Summary

Directorate General XII of the European Union finances the Spanish Mediterranean Relay Centre (CENEMES) in which R+D Service (OTRI) of the University of the Balearic Islands takes part together with the University of Alacant (coordinator), the Promotion Institute of Murcia (INFO) and Medium and Small Industry Institute of Valencia (IMPIVA), so the area that this centre extends have in common particular socio-economic characteristics and problems. Furthermore, CENEMES is one of the 52 relay centres already established all around Europe that have the following objectives:

- Innovation promotion in the local industry, specially by exploiting the research results and transferring of technology.
- Participation promotion in European Union R+D Programmes and the diffusion and application of their results.
- Information spreading on transfer, results exploitation and participation in research projects.
- Partners searching for national and european projects.
- Scientific and technological offer and demand diffusion.

The activities of this centre do not concentrate inside the University of the Balearic Islands, but its aim is mainly to increase the participation of Balearic enterprises in research and technological development projects and the results transfer from projects carried out in our University to the productive system, both in our geographical area and all around Europe.

Summary:

Due to the geographical environment of the University of the Balearic Islands (UIB) -it covers several islands- we are a good testbed for demonstration experiments like those of ARIADNE Extension proposal. The UIB has its head office at Mallorca, major island of the Balearic Islands. The following table shows the implementation plan of studies in Menorca and Eivissa and estimated number of people attending them in Menorca and Eivissa:

	<u>Menorca</u>	<u>Eivissa</u>	<u>Number of students</u>
1st year	Teacher: infant education (I)	Teacher: infant education (I)	120
2nd year	Teacher: infant education (I, II) Business administration	Teacher: infant education (I, II) Business administration	240
3rd year	Teacher: infant education (I, II, III) Business administration (I, II) Telematics (I)	Teacher: infant education (I, II, III) Business administration (I, II) Telematics (I)	360
			240
			120

In this scenario we will mix traditional classes and methodologies with distance learning classes and new methodologies based on telematics services (videoconferencing, telematic information, computer based systems, electronic mail communication, etc). In this way we will be providing an easier access to education to students of the other islands that have socio-geographic and economical disadvantages. We will use the tools developed for ARIADNE project in order to produce the pedagogical material, offered as on-line material and to process and evaluate the response of the academic community (teachers and students) to this innovative approach.

Summary

Carob is an important crop for mediterranean countries, ususlly founded in marginal soils. Market expectatives for pod an mainly seeds is very promising. Therefore different efforts should be devoted to improve the basic and applied knowledge on this crops.

The different groups of this Project are aimed to develop basic research on mineral nutrition physiology of the tree, propagation techniques, by cuttings or “in vitro” culture, and othe basic aspects of the field behaviour of this crop. Applied research will be also done in these groups as well as in the new orchards of carob trees located in Andalucia propiety of the company also included in the Project.

Summary

The interest of chlorophyll fluorescence as a putative signal for detection and accurate analyses of physiological phenomena associated with water stress, the most limiting factor for crops yield over the world, led us to apply for the series of projects developed at LURE since 1996 (see Experimental Report).

The results of previous projects revealed that several signals related with chlorophyll fluorescence (particularly the steady-state signal, Fs), can be excellent tools for early detection of water stress (Cerovic et al., 1996; Flexas et al., 1998a, b, c; Flexas et al., 1999). Also, evidences for a qE-related process involved in the down-regulation of Fs as a response to water stress have been obtained through time-resolved measurements using the Super-ACO equipment and from photochemical reflectance index (see Experimental Report).

Now, apart of the possibility of repeating some of the previous experiments due to technical problems during the previous measurements (see Experimental Report), we are interested into extend our study to fluorescence signals different to that of chlorophyll. It has been recently reviewed the special index of blue-green fluorescence and of red(chlorophyll) to blue fluorescence ratios for plant stress assessment (Lichtenthaler, 1996; Cerovic et al., 1999). Blue-green fluorescent molecules in leaf epidermis are mainly phenolic and other compounds related with plant secondary metabolism, which increase their content as a response to environmental stressed, like water stress (Cerovic et al., 1999). Of particular interest for stress assessment is the shift from a dominant chlorophyll fluorescence and low blue-green fluorescence under control conditions. Grapevines have important amounts of phenolic compounds in leaves and, specially, in fruits, to which they confer most of the characteristics related with fruit quality. It is now that water stress strongly affects to the characteristics of phenolic metabolism, at least in fruits (Escalona et al., 1999 and unpublished). Thus, blue-green fluorescence studies seem to be also a promising tool for water stress detection in grapevines. The multiwavelenght capability of synchrotron radiation makes it a good instrument for this kind of analyses (Cerovic et al., 1994).

The aim of the present project is to obtain a first collection of data of combined measurements of chlorophyll fluorescence and blue-green fluorescence throughout a period of continuous water stress development in plants of grapevine. These first results may indicate if the study of blue-green fluorescence is or not a good, new way, for stress monitoring in grapevine crops. The proposed experiment is:

1. Cultivation of grapevine plants at the greenhouse of Orsay University, under conditions of high light and temperature, as already done in previous experiments (Flexas et al., 1998a).
2. During the development of water stress in these plants, continuous monitoring of chlorophyll fluorescence and gas exchange ratios under greenhouse conditions, to get good estimations of Fs variations with water stress (Flexas et al., 1998a).
3. Also, leaf samples will be taken daily along the time of water stress development. These samples will be kept in cold several days until they were analysed using the synchrotron radiation. Excitation spectra of red and blue-green fluorescence will be determined.

Summary

Ceratitis capitata is in Spain a key pest due to its destructive effect on so many commercial fruits as citrus, peach and apricots. Other non commercial host as *Ficus carica* and *Opuntia ficus-indica* are also key host because of their importance as medfly reservoirs. At the moment, control measures are based on repetitive insecticides bait sprays which have serious effects on natural enemies and on fruit quality. In this sense, it is important to reduce insecticide treatments using environment-friendly and cost effective techniques as an alternative to conventional insecticides. Environmental protection measures are also increasing the need for alternatives to conventional pest control, and we have to consider that Menorca island and some areas of Ibiza island have been declared Reserves of Biosphere by UNESCO. Standard and effective monitoring systems are needed for IPM strategies, reflecting precise changes in temporal and spatial distributions of the medfly. Detection and monitoring population is critical in the Balearic Islands, because the possibility to control the pest at two moments over the year when the population is very low. At this moment, selective and effective captures will reduce the pest below the economic damage level, thus reducing or even eliminating the use of insecticides. On the other hand, the olive fly *Bactrocera oleae*, is also an important pest in Spain. This monophagous pest requires as in the case of medfly, an area-wide approach. For this reason, it is also important to develop effective attractants for monitoring and for use on a mass trapping strategy basis. Finally, geographical situation of the Balearic Islands is an adequate place to study isolated populations.

Summary

The specific objectives of the pilot are summarised as follows:

1. The identification of training needs for the promotion of health telematics technological research, development programme and there application.
2. The development of a health telematics network for training and the transfer of new technology.
3. The development of a new multimedia based training methodology for health telematics.
4. The development of a health telematics educational package organised in modules concerning specific skills which are necessary for teleworking in the health sector.
5. The training of trainer and pilot application involved will lead to the better use of new applications and advance the effectiveness of teleworking in the health sector.

DEPARTAMENT DE CIÈNCIES DE L'EDUCACIÓ

- FARRUTX**, towards a township model of environmental interpretation in saturated touristic areas.
SUREDA NEGRE, Jaume

Referència: 99/136576.

Títol: FARRUTX, towards a township model of environmental interpretation in saturated touristic areas.

Centre: Departament de Ciències de l'Educació. Edifici Guillem Cifre de Colonia.

Investigador principal: SUREDA NEGRE, Jaume.

Categoría: CU (àrea de coneixement: Didàctica i Organització Escolar).

Inici: 2000. **Fi:** 2002.

Summary

This project is based on four fundamental premises:

(a) The consideration of interpretation as an instrument or strategy of management for making the conservation of the natural heritage compatible with the offer of services for visitors. With the application of interpretation programmes not only can we promote behaviour which is in harmony with the place visited, by raising the awareness of the importance of conserving it, by stimulating and persuading, but we can also promote economic and social development. Interpretation makes up one of the most effective indirect methods for controlling the impact of visitors, for redirecting the influx of tourist and for managing the natural and historic heritage.

(b) The conservation of a township as the most suitable space for the development of programmes which are directed at making economic development through tourism compatible with environmental conservation.

(c) The widely accepted consideration that educational strategies directed at solving environmental problems must intervene from the local dimension of an environmental problem, from the conservation of a territory, of a heritage asset, etc. so as, from here, to begin to introduce a broader, worldwide dimension of the environmental issue.

(d) The observation of the scarce development of interpretation in countries in the south of Europe. This situation is in contrast with the capacity that this strategy possesses as a means for the management of visitors.

This project seeks to design, perform and test an environmental programme that makes possible the definition of a model for carrying out environmental interpretation programmes in tourist resort of Mediterranean Europe. Within this framework, the main goal of the project is to offer a product -the model- based on the theory and the practice - the programme- that can become a motivating and exemplifying element in the use of interpretive and educational strategies for the protection and improvement of the environment in tourist areas.

Summary

There are many examples of failures in the development of both Management Information Systems (MIS) and Real Time and Embedded Systems (RTES) domains. These failures can almost always be traced to mis-management in the early phases. Therefore this project will concentrate on these phases to generate soundly based development processes in the transformation of user requirements into an architectural design. It is also recognised that there is still significant immaturity in the way in which software intensive computer based systems are developed. This indicates that there are serious gaps in processes and methods which are in general use. The methods used offer only single point solutions; the tools tend to be stand-alone with no facility for integration. The situation is not improved by the lack of any proven, universally accepted, foundation for the engineering of software-based systems. What is required is sound architectural foundation capable of providing a meaningful understanding of crucial aspects such as: system behaviour, resource utilisation, performance, reliability, maintainability and reconfigurability. Developers tend not to adopt component based construction (composition) strategies and thus cannot exploit re-use during design, implementation and evolution in service. The need for V&V during the early stages is not generally recognised, and its absence contributes to many problems in development projects. The issue of risk is an all pervading aspect of systems engineering which is not given full consideration during the formative early stages. The increasing number of computer base systems indicates that it is necessary to improve the process so that better quality systems can be developed and also that these better quality systems must be developed significantly more quickly than is currently the norm.

Summary

This is a proposal for research on problems related to the theory of viscosity solutions and its applications. The theory of viscosity solutions is one of the most central and fastest growing areas in the field of nonlinear partial differential equations. Its scope extends from rather deep and challenging mathematical problems to the modelling and analysis of a large number of applied problems in science, engineering, atmospheric/ocean studies and economics, which include, among others, phase transitions, moving fronts, statistical mechanics, combustion, turbulent reaction-diffusions, optimal and stochastic control, mathematical finance, image processing, etc... The understanding of such applications obviously requires, in addition to theoretical results, extensive computations and efficient numerical methods, which can be derived and analysed using the theory of viscosity solutions.

The long list of applied areas and problems which can be studied using methods related to viscosity solutions, the rather difficult and challenging mathematical problems that encompass as well as the astonishing progress already achieved, in such a relatively short (for mathematics) period, using viscosity solutions has generated an ever growing interest in Europe, US, Japan and China. An indication of the growing importance of this theory for mathematics is that, since 1981 when M. G. Crandall and P.-L. Lions introduced the concept of the viscosity solution, more than one thousand papers related to the subject have been published in mathematical journals of high quality, a rather amazing fact for mathematics. A proof of the importance and relevance of viscosity solutions for applied mathematics is the fact that they have already been used successfully to analyse a large number of questions related to the applications mentioned above. Europe is in a unique position to be at the forefront of this theory. Some of the leading groups in the world in the theory of viscosity solutions and its applications are located in Europe and all of them are participating in this project. Bringing them together increases the talent, the ability and the expertise needed to address the new problems. The resulting interaction among groups working in some aspects of the applications will definitely increase the understanding and provide the necessary input and ability to address the even more challenging problems

lying ahead of us. Besides its mathematical importance, further progress in the theory of viscosity solutions and its applications will lead to better, and, in some occasions, important, understanding in sciences like physics, chemistry, in atmospheric-ocean studies and medicine through progress in, for example, material sciences, image processing, front propagation, microphysics of clouds, in engineering and technology in general, through progress in combustion, material sciences (crystal growth, phase transitions) and image processing, and in socio-economic issues, like mathematical finance, environmental economics, the study of the environment, etc. Finally carrying out research in the theory of viscosity solutions and the activities surrounding this research will result in educating a whole new generation of young researchers, the so-called New Applied Mathematicians, who will be able to do modelling, theoretical work at the highest possible level of Mathematics and numerical computations, and will be involved in real problems.

Keywords: high performance computing and networking, networked architecture design, 3D CAD, cooperative work, virtual studio, multimedia interactive communication service.

Summary

The objective of the project is to integrate the CAD technology with the VR and high performance network technology to be a prototype multi-site cooperative 3D system for architecture design. The foreseen prototype system will extend the major functions of the single user CAD architecture design tools to a networked cooperative system at multiple locations. Real time interactive cooperative design with audio/video conferencing will be realized in the systems with other off-line functions. The current target geographic area to cover is at the European scale. It can be extended in the future. For cooperative architecture design, real time cooperative design working sessions linking long distance users will be available. The project will develop all the necessary multi-site cooperative editing tool, real time distributed visualisation tool and network communication tool for this purpose. As an important element, a shared database containing all the architecture designs information, not only geometry, but other related information will be developed for the system. The multi-site users will be able to input their own 3D designed components together into the system to form a global design, visualize them, modify the attributes of the component and the whole environment. Modifications of the design will be sent back to the related users. High volume, high speed network connection will be established for data transmission including image data, digitized audio/video signal, text, graphic primitives, control signal, etc. Euro-ISDN network will be considered first for the system, due to the wide availability and flexibility of changing the bandwidth according to the workload. It will be linked to the local ETHERNET or ATM networks. An interactive approach will be taken for the development of the project. The rich experience of the user partners in the construction industry will be most valuable for the project since the system will be most valuable for the project since the system will be developed for their use. The user partners in the project will be actively involved in the project definition phase, project development phase and the integration phase. In general, M3D system development will

be user-oriented instead of technology-push. The user partners will play a major role in the definition of the project. The users will also make simple trial in the prototype system. They will test critical elements during the development phase such as the multi-site editor, distributed visualiser, the network connection, etc. The iterative approach will be even emphasized in the third project year. The test results of the user to all the elements will be taken into account for the integration of the alpha, and beta version of the system (user feedback integration). They will have a full trial test using real like architecture project during the third project year. The foreseen prototype system will supply the necessary turnkey technology for a significant change of the traditional architecture design process in Europe. The project will demonstrate how the cooperative networked integrated system of architecture can provide much higher accuracy, efficiency, and flexibility in the architecture design process. It will also show the potential of the new market in Europe for architects in each country to work in international consortiums within architectural projects. The result of the project will facilitate the application of the HCPN in this high potential, cata extensive industry sector. It will contribute to strengthen the competitiveness of the european architecture design sector. The consortium will pay special effort for the exploitation of the project result. To make the industry aware of the new system and collect the feedback from the industry during the project time, dissemination activities such as workshops and demonstrations will be organized. The organization work for exploitation of the project result will be implemented at two different levels: within the consortium and outside the consortium. A product will be defined from the project and commercialization of the product will be strongly welcome.

Coordinador: Departament d'Urbanisme i Ordenació del Territori. Universitat Politècnica de Catalunya (Espanya)

Summary

Objetives:

1. Develop a series of designs of new sustainable patterns for the low density residential areas that improve the environmental adequacy of current solutions. In that way proposed patterns have to be adapted to the specific character of Mediterranean landscapes as a climatic and cultural region. These patterns will be designed to act today in the same way as traditional constructions in urban and rural developments have done versus environmental policies and will function as an appropriate alternative to current touristic and suburban settlements very inadequate from the point of view of sustainability and not concerned with supporting and improving the identity of regions in South Europa.
2. The design of an informatic product that permits to introduce projectual arguments in the definition of parameters that describe territories in a global environmental vision and then an IAM -integrated assessment model- which introduces, in addition to the well - known system of environmental factors of common IEA, the visual and cultural aspects and, in that sense, to integrate planning policies with design issues of transformation.

Work content outline

1. Elaboration of an IAM (4 entries: environmental factors, image and cultural heritage aspects, planning and management, socio-anthropologic factors).
2. Design of new touristic/low density residential patterns.
3. Definition of the conditions assumed by the patterns (feedback the IAM).
4. Verify the adequacy of patterns. Introduction of uncertainty factors as probable alternative scenarios. Readjustment of the design of the patterns.
5. Verify the capacity of the areas through the multiplication of the selected patterns, establishment of limiting situations.
6. Configuration of criteria of implementation of new patterns in the Mediterranean region.
7. Final formulation of the Integrated Environmental Assessment.

From the point of view of the methodology, two entries of work are proposed. The first deals with the analysis of 6-12 units of 400 km², to the scale of 1:25.000 (during the

process through a sequential zoom we reach the scale 1:2.000) in countries such as Spain, Portugal, Greece, South of France and the South of Italy, understood as reference areas of characteristic landscapes. The second one consists of the research of new patterns based on recent needs associated with touristic developments and new lifestyles such as rural and “telework” developments and the study of the traditional types of residential units to the scale 1:2.000. Both are the basis to elaborate an IAM that can be translated in an informative product directed to evaluate criteria of a sustainable implementation of new residential patterns in the mediterranean region.

Claimed innovative aspects of this proposal include:

- the introduction of visual parameters in the environmental assessment. The role of the image is considered basic in the pondering of values, especially in areas where sustainability is supported by the touristic development or in deteriorated ones where the achievement of a “good landscape” is vital for their revaloration.
- the incorporation of cultural factors in the environmental assessment which are considered as a means for the modeling of the form and the establishment of strong points in the area of cultural heritage. In that sense, the study of basic traditional settlements is of great significance.
- to consider the feed back process -patterns-IAM- to the re-design of new patterns and first proposal of IAM with the aim on one hand to integrate patterns into appropriate areas and on the other to directly improve both them and the IAM.

Summary

The project aims to improve scientific knowledge and understanding of the development and downwering of shore platforms and of the relationships between shore platform change and the rates of retreat of sea cliffs on the landward side of the platforms. Shore platforms are a major component of European rocky shore environments, but in the past there has been a dearth of hard data concerning the weathering and erosion of the platforms on which to base long-term planning strategies. The project brings together a multidisciplinary team of scientists from universities in five EU member states to employ a newly developed laser scanner and a standardised methodology. It will further understanding of the development and dynamic of shore platforms in contrasting rock types at sites representative of the full range of wave and tidal environments experienced around the shores of Europe, from the Mediterranean northwards along the Atlantic coast and into the Baltic.

Summary

The research program of the Mediterranean Programme is structured in the following way. It is characterized by one key research perspective and structured into research topics. The research perspective is that flows of persons, goods, and ideas between the Northern (Europe) and Southern Mediterranean, as well as among the Southern Mediterranean countries are fundamental in understanding the crucial dynamics in the area. The Mediterranean Programme has indicated a few research topics. In the realm of socio-political studies (alphabetical order): Business and politics, euro-mediterranean partnership, images and discourses, Islam and politics & economics, migration, political regime analysis. In the realms of political economy studies (alphabetical order): competition policy and implementation, development of financial markets-banks, the stock exchange and other financial intermediaries, private sector and corporate structures, privatization policy and practice.

Summary

Policy questions are considered as some of the most important barriers vis-à-vis the development of electronic commerce for different reasons. At the same time, regulatory and self-regulatory solutions are a key element to enhance trust in e-commerce both in business-to-business transactions and in business-to-consumer ones. Nevertheless, the recent European Commission Proposal for a Directive on certain legal aspects of electronic commerce in the internal market has clearly underlined the significance of legal costs for operators wishing to develop on-line activities. According to the survey undertaken by DGXV, 36 % of respondents did not consider the legal situation of their product or services. A third thereof could not afford to undertake an evaluation of the regulatory framework, such an analysis being considered as too expensive. The estimated costs given by those operators having carried out such an evaluation, are very high. Therefore, a great number of SMEs, not capable of affording such costs, could be discouraged from exploiting new possibilities offered by the information society, or could run into illegal practices, etc.

ECLIP II Project seeks to fill this gap by analysing the delicate above-mentioned new questions, and by assisting all the interested actors on that basis. Therefore, the main objectives of ECLIP II are :

1. increase awareness of the regulatory framework in which e-commerce is developing and of the legal, extra-legal (such as self-regulation, alternative dispute resolution, labelling of web sites, ...), and technological (such as Privacy-Enhancing Technologies, PICS, Electronic Copyright Management Systems, watermarking, electronic signature, etc...) solutions to policy issues
2. provide education and information on the regulatory framework of electronic commerce
3. set up an distance teaching program on the legal issues of e-commerce
4. help RTD projects, funded by the 5th Framework Program, to address and integrate early on ethical and legal concerns in the design and development of their e-commerce project
5. build practical tools and guidelines to help consideration of legal constraints
6. initiate, carry out and stimulate new study on the policy issues of e-commerce, namely by integrating in the reflection extra-legal approach, such as self-regulatory mechanisms or best practice, and technological resources and solutions
7. support and stimulate EC policy in the field of e-commerce, namely by highlighting the need for legislation or discrepancies and inconsistencies in the existing Member States or European regulatory framework.

Summary

Public Administration organization and proceedings have to be transparent for the citizens. Public administrations should be seen as a set of separate entities, without any sort of relationship among them, geographically scattered and with different opening hours to the public. On the contrary, the concert, the concept of “one stop shopping” will imply a better accessibility and a quick answer by Public Administrations. With the introduction of the new technologies, the service quality will be significantly improved and thus enhancing the image that society has of the public sector in general. Public Administration on line will allow citizens to break with the geographic and demographic barriers and the lack of proper information thereby boosting the interaction with citizens. Obviously, one of the issues that European Public Administrations need to improve is their efficiency and effectiveness in order to increase the standard of living of the present residents, to improve business conditions and to facilitate companies creation. Public Administrations cannot follow traditional lines; they have to firmly commit themselves for the integration of new technologies as an instrument for promoting development. Within economic and social policy of the European Union and its Member States, employment creation is on the top of the agenda of all governments. One of the most successful ways to support employment creation are to promote competitive companies, in particular SMEs, and the setting up of new ones. Even if national and regional governments make great efforts to attract new businesses the reality demonstrates that there are a great number of barriers and impediments to create new business.

One of these barriers is the infinity of bureaucratic procedures that have to be fulfilled in different Public Administration (national, regional and local) until arriving to constitute formally a company. To request a presentation, a subsidy or a license to constitute a company is often a long process. Citizens who wish to set up their own company are victims of the lack of information, a heavy administrative burden, etc. These problems are even more important and difficult to overcome if a European citizen wants to establish his company outside of the region or country of origin. Different legislative documents in

different languages, the lack of knowledge regarding procedures to follow or which administration to attend, poses a real obstacle in time and money for SMEs.

It is evident that the European Public Administrations need to improve their efficiency to increase the standard of living of the residents, to improve economic conditions, and to facilitate the business creation. European Public Administrations can not continue to follow traditional approaches and procedures, they need to encourage and foster the transfer of know-how and the integration of the new technologies as instrument to promote regional development. The INFOBusiness project (Information Network for Business and Employment Creation) aims at reducing administrative barriers and support citizens in the process of creating a new business. This will be achieved by a greater transparency on the steps required to set up a new business and the electronic procurement of the documentation. The consortium set up a Site and a database, containing the necessary documents from different parts of the administration and provide easy to understand guidance to entrepreneurs on how to overcome the administrative barriers.

INFOBusiness objectives are:

- To facilitate administrative procedures in the business creation
- To help to overcome administrative barriers
- To collaborate with entrepreneurial organizations
- To review administrative procedures for setting up new business
- To collaborate with public and private employment agencies to provide required staff
- To create a link to the transnational employment seeker database EURES

These objectives will be achieved through:

- Changes in the procedures
- Public Administrations focus on client
- Improvement of the communication among and within Administrations
- Continuously improved business environment

The bottom line of INFOBusiness will be:

- To develop a pilot system that brings administrations in the area of business and employment creation closer to the public and to prove its validity of this system and its applicability by any European Administration
- To establish a European multilingual information network for business and employment creation on the Internet integrates know-how and documentation of several Public Administrations of three different countries (Spain, Ireland and Germany)

The strategical importance of this project for the Administrations and entities involved guarantees its continuity, as thanks to INFOBusiness, the welfare and employment level in the regions will increase. Moreover, due to the INFOBusiness partners, it will be easier to draw the attention from other European administrations for their possible integration into the system in future phases.

Coordinador: Centre de Recherches Informatique et Droit (CRID) (França)

Summary

The action of the European Commission concerning *extra-judicial body for the settlement of consumer disputes in the field of electronic commerce* is aimed at enforcing European consumers rights in the context of the Internet. The aim of the ECODIR project is to set up a prototype devoted to the electronic resolution of consumer disputes arising on the Internet. The prototype created will allow all steps of the resolution process to be electronic. To reach this objective, the ECODIR project has a double advantage:

- First, the ECODIR project has constituted a Consortium of experienced partners, including European Universities as well as American partners specialised in the resolution of disputes on the Internet. Those American partners are the CRDP (Centre de Recherche en Droit Public) of the University of Montreal, who has set up the CyberTribunal (<http://www.cybertribunal.org/>); and Professor Ethan Katsh from the University of Massachusetts who has created the Online Ombuds Office (<http://www.ombuds.org>).
- Second, the approach of the Consortium is multi-disciplinary: it takes into account the European specificity on a cultural, social, organisational, economical, institutional and legal basis.

The participation in the Consortium of this Canadian partner brings the following advantages:

- It allows the ECODIR project to benefit from the Canadian prototype and to implement it in Europe;
- It enables the ECODIR to provide European consumers, as soon as the project begins, with the possibility to submit their disputes to the Canadian body, having the disputes treated by a European secretariat;
- It allows the project to take an international dimension due to the participation of the Canadian partner, ensuring consumers to enforce their rights granted by national and European legislation.

It is important to mention that the CyberTribunal already takes into account the principles set up in the European Comission Recommendation on the principles applicable to the bodies responsible for out-of-court settlement of consumer disputes (refer to <http://www.cybertribunal.org/english/html/principles.htm>). One important fact about the practice of the CyberTribunal, 90% had a European dimension (i.e. at least one of the party was European). The ECODIR project plans to implement a European prototype approximately at the half of the project (i.e. beginning of 2001). This implementation at the half of the project is aimed at ensuring a monitoring by the partners of the project in order to improve the prototype until the end of the project. Finally, the ECODIR project should deliver an operational prototype consumers could refer to when a dispute arises on the Internet.

DEPARTAMENT D'ECONOMIA I EMPRESA

- EUROMOD: an integrated european benefit-tax model.
SPADARO, Amedeo

Referència: CT97-3060. Programa TSER.

Inici: 1997. **Fí:** 2000.

Socis:

[Coordinador: University of Cambridge \(Regne Unit\)](#)

Summary

It is proposed to construct an integrated benefit-tax model covering all 18 European countries, focused on social and integration policies and their implications for the economic resources of people who are socially excluded. The 'model' will be independent of any particular theoretical perspective, relying on the richness of the information provided in available household micro-data. It will therefore be of considerable use in the evaluation of a wide range of policy proposals in many contexts over a long period of time. The model, EUROMOD, will provide a consistent Europe-wide framework for the analysis of public policy changes and their impact on the socially excluded. It will make a significant contribution to European social science research infra-structure, and hence to the objectives of Area III.5.

It is proposed to build EUROMOD in conjunction with a group of potential users of the model's output. In addition to actually constructing the mode, a preliminary set of analyses will be carried out in collaboration with this group. These analyses will focus on some major issues related to the promotion of social integration.

The immediate aim of the proposal is to build a durable and robust framework for Europewide policy analysis over the short-term. It will also provide a platform for more speculative and experimental research exercises in the future. The model will be built with both these objectives in mind.

EUROMOD will be of value both in assessing the consequences of consolidated social policies and in understanding how different countries may contribute to the common objective of reducing social exclusion. It will be of as much significance in evaluating national policies as in evaluating policies at the level of the European Union.

Summary

The development of increasingly sophisticated lasers, nonlinear optical materials, detectors and traps has made possible the observation of an impressive range of nonlinear and quantum optical effects. Among these are the self-organisation of the light produced by nonlinear optical systems, the production of intrinsically quantum states of light and the trapping and cooling of small numbers of atoms or ions. The principal objective of this network is to bring together expertise in nonlinear optical patterns, atom and ion trapping and cooling, and the quantum properties of light in order to carry out a comprehensive study of the quantum features associated with self-organising systems. To date, almost all of the work on such systems has been limited to the classical regime, but our experience with quantum effects leads us to believe that we can extend these studies into the fully quantum regime of operation. Indeed, the teams forming our proposed network are uniquely qualified to undertake this study. Such an extension is important and novel for two reasons: Firstly, this is a new regime of optical physics at the interface between nonlinear dynamics and quantum physics and it provides scope for new and rich behaviors such as those predicted in studies of quantum chaos. Secondly, as optical devices get smaller we can expect quantum effects become of increasing significance in their operation, with the most interesting behavior arising from the interplay between nonlinearity and quantum effects. Although there is a strong interdependence between the underlying tasks of these two research topics, it is natural to divide our programme into two main objectives:

- Quantum effects in optical patterns (quantum images). To carry out an experimental, computational and theoretical study of quantum properties associated with spatio-temporal patterns produced in optical parametric oscillators (OPO), intracavity second harmonic generation (ISHG) and Kerr media.
- Preparation and study of ordered arrays of ions and atoms. To carry out an experimental, computational and theoretical study of the quantum properties associated with ordered arrays of trapped atoms and ions.

Summary

There are five major objectives that will be achieved through this Network, important for GWA, that will not be possible without it. In summary they are: (1) The formation of a close alliance among the different expert groups to solve urgent problems required for GWA, too large and complex for any single group to tackle. Such a Network is needed, but does not exist at present. (2) The development and training of a young community of researchers to populate this emerging research area of GWA. Although there are strong, isolated European groups working in relevant research areas, there is no coordinated effort to build up the broad-based expertise required for a systematic attack on these problems. (3) The development of a community simulation code for relativistic astrophysics: Cactus. Simulation tools are essential for the success of this research area. As described below, the development and use of Cactus will be an important part of the training program for this Network. (4) The development of appropriate approximation tools, such as perturbation and post-Newtonian theory, to provide better physical understanding and conformation of numerical simulations. Without such schemes, simulations may provide little insight into the actual physics, and may be completely misinterpreted. Further, semi-analytic results may be used to confirm and validate numerical simulations in appropriate regimes. (5) The application of these tools to a set of core astrophysics problems, considered among the most urgent for the detection and interpretation of the first signals seen in the GEO and VIRGO detectors, and also seen as excellent focus problems for the development and training of the community and its research tools. These problems include GW signals from NSs and BHs.

Summary

To develop a competent network of laboratories with the capacity to develop, conduct and coordinate collaborative research and training, and thereby ensure that age determination becomes a reliable element of the assessments underlying the scientific management advice on fisheries and environmental resources

Objectives:

To stimulate international collaboration by offering services and facilities to workshops, conferences, visiting scientists and students focussing on ageing research and methods.

To recommend practical development of existing ageing methods, including computer, techniques, with a view towards rationalising current practices while satisfying the demands for speed, accuracy and consistency.

To develop and update a library of methods descriptions and reference collections for different species and stocks for use in training and intercalibration exercises.

To improve the accuracy of current and new ageing procedures by recommending a range of verification procedures based on both classical and novel techniques

Summary

Objetives:

The main objective of this proposal is to study the relationships between the recruitment process of European hake (*Merluccius merluccius*) and its fishery in the NW Mediterranean.

This objective is itemised as follows:

To analyse the effects of the young hake fishery on the demersal community, This includes the effect of fishing on the demersal communities and the geographic allocation of the fishing effort.

Study of the hake recruitment processes. Spatial distribution of eggs and larvae. Settlement process. Juveniles and larval growth and ecology.

To analyse the impact of the fishery on the spawning stock.

Summary

Objectives:

The overall objectives are to predict the response of rocky ecosystems to increased nutrient availability by

- 1) modelling the changes in ecosystem processes
- 2) evaluating the increased production of herbivores
- 3) assessing effects on growth responses of key organisms
- 4) predicting the resulting ecosystem structure and metabolism.

In doing so, EULIT would allow the formulation of tolerable nutrient inputs to coastal waters, and to evaluate the capacity for increased production of animal protein as a side benefit of the buffering effect exerted by herbivores.

Summary

The objective is to contribute to the sustainability of SE Asian coastal ecosystems through the development of models predicting the resilience of SE Asian seagrass and mangrove ecosystems against human pressure. These models, simple enough as to be readily embedded in current frameworks for integrated coastal management, will assist decisions by coastal managers and policy makers.

Summary

The objectives of the concerted action are to achieve a European consensus on the selection and implementation of:

- 1) a network of reference sites as the basis for long-term and large-scale marine biodiversity research in Europe.
- 2) internationally agreed standardised and normalised measures and indicators for (the degree of) biodiversity.
- 3) facilities for capacity building, dissemination and networking of marine biodiversity research, by a) workshops, b) improving training and mobility, c) an internet web-site including an overview of ongoing research programs and existing infrastructure for marine biodiversity research in Europe, d) a database on, reviewed and evaluated, available data, aiming at employing data for socio-economic questions such as the impact of fisheries or tourism.

Summary

The objectives of this network are twofold and are concerned with both theoretical and experimental results. On the theoretical side, the general objective is to gain a better understanding of microlasers and cavity QED through the establishment of more elaborate theories than existing ones. On the experimental side, the objectives are to demonstrate the effects predicted by the new theories and to propose compact sources of light with tailored quantum noise and methods of measurement taking advantage of the quantum properties of the field.

Summary

Opto-electronics will have to play a crucial role in future development of communications and information processing and, as a consequence, will influence very much our society in the next years. The Vertical Cavity Surface Emitting Lasers (VCSEL) are likely to become much more important than standard semiconductor lasers in the near future in optoelectronic devices. In order to reach this major breakthrough, an effort must be faced for solving some problems related to the VCSEL behaviour, in particular for polarisation instabilities pattern complexity, modulation patterning effects, low power, thermal lensing and feedback effects. Even more important, VCSEL special characteristics can be fruitfully used for improving systems performance, for instance with polarisation control, by employing spatial structures for information processing, by achieving quantum-limited performance. The main objectives of the Project are the understanding of the underlying physical mechanisms relevant to VCSEL operation, the subsequent improvement of their efficiency and the transfer of this knowledge to VCSEL based systems. These objectives are achieved by exploiting new possibilities associated with VCSEL features and by novel kind of lasers and device concepts.

At this purpose, a tight collaboration is necessary among laboratories with device construction facilities, laboratories with nonlinear and quantum optics and electronics expertise, theoretical groups. Indeed, the samples production requires a large research infrastructure and few European groups (and in few European countries) have this possibility. Besides, a complete characterisation and understanding of the laser behaviour implies specialised competencies and must be performed by groups with the necessary experience. This network will provide the link between the most important European groups in the involved research fields, connecting device production, characterisation and implementation in communication systems.

Summary

The aim of this project is to characterize further the biochemistry/molecular biology as well as the physio-pharmacologic regulation of imidazoline receptors and alpha-2 adrenoceptors in the central nervous system. The imidazoline receptor, I₂ type, are new molecular entities which appear to be associated with the enzyme MAO-B and with the expression of GFAP in glial cells. The project therefore will assess the involvement of these receptors in the pathophysiology of endogenous depression and Alzheimer's disease.

Keywords: genetic differentiation, coleoptera, geographic isolation, spetiation, phylogeny.

Summary

The Canarian archipelago and the mountain ranges of Iberian Peninsula may be considered as natural laboratories for studying the genetic differentiation of endemic species of coleopterans belonging to the genera *Pimelia*, *Hegeter* (Tenebrionidae), *Timarcha* and *Chrysolina* (Chrysomelidae). These species are characterized by their low dispersal capacity and many of them have been previously investigated in several genetic features. The nucleotide sequences of satellite DNAs in species of *Pimelia* and *Hegeter*, those of mtDNA gene COII and nuclear rDNA spacers in *Timarcha* and *Chrysolina*, will be used as genetic markers to determine the degree of evolutionary divergence and build up phylogenetic trees through appropiate algorithms. The molecular findings will be compared with those derived form molecular cytogenetic analyses on the same species by fluorescent in situ hybridization (FISH) using satDNA probes in *Pimelia* and *Hegeter*, and of ribosomal DNA of 18-28S and 5S in the four genera subjected to study.

Keywords: *k. pneumoniae*, outer membrane, porins, LPS, complement, antimicrobials.

Summary

Previous results obtained by our group have demonstrated the important role of outer membrane components, particularly lipopolysaccharide and porins, in the resistance of *K. pneumoniae* to complement-mediated killing and antimicrobial agents. The present project aims to more detailed study of the role of the above two surface components in the cited resistance phenomena by:

1. Determining the unknown bases of complement resistance in lipopolysaccharide O-hospital-occurring isolates.
2. Structural characterization of the site(s) within the OmpK36 porin responsible for the binding of complement component C1q and subsequent antibody-independent activation of the complement system.
3. Determine the mechanisms that lead to the loss of porin expression or the expression of altered porin forms with the subsequent increases in antimicrobial resistance levels.

Keywords: symbiosis, molecular coevolution, genomic conflict, darwinian selection, neutral theory, supergen, nucleous-mitochondria interaction.

Summary

Compared to endogenous evolutionary processes, symbiosis is a rare event that increases genetic complexity and the appearance of evolutionary novelties. However, it played an important part in the origin of eukaryotes, and has also been invoked to explain the origin of chromosomes and of the first cells. Nevertheless, the evolutionary success of the symbiotic interactions occurs within biological entities that, depending on the hierarchical level, complet for diverse resources. This competition could result in a genomic conflict between the symbiotic partners and the new symbiotic entity. The aim of the present grant proposal is to elucidate the role that Darwinian selection could play in the evolution and maintenance of: a) the symbiosis between *Buchnera aphidicola*, the endosymbionts of aphids, which is suffering deep structural and regulatory changes compared to close free living bacteria such us *E. coli*; b) the interaction between nuclear and mitochondrial genomes (as a consequence of a very ancient symbiotic process) in *Drosophila subobscura*, for which we have already identified mitochondrial haplotypes exhibiting presumptive fitness differences, and c) chromosome rearrangements (considered as supergenes) in *D. subobscura*, organisms which shows a high plasticity in the generation and adaptive maintenance of chromosomal polymorphisms. The methodology involved in the present proposal is quite diverse, covering from the analysis of the structure and regulation of different genes, to the molecular population and phylogenetic analysis. In reference to section a), we pretend to implement a new methodology, the so called 'molecular coevolution', consisting in the comparative study of the evolution of genes coding for subunits interacting in the same protein complex, that could be encoded in different genomes. This methodology goes beyond the aims of the present proposal, but has been included as an objective because it can also be very useful to unveil the transformations occurred in genomes involved in symbiosis and their causes.

Keywords: chuetas, STRs, mtDNA, human populations, genetics of myopia, genetics of otosclerosis.

Summary

The aim of the project is to study the genetics of the human population of the Balearic Islands by means of the analysis of individuals from Majorca, Minorca, Ibiza and Chueta populations. The level of polymorphism in nuclear genes (STRs) and in the hypervariable region I of mtDNA will be detected. We will establish the filogenetic relationship between our populations and between them and other mediterranean ones of the literature. We are specially interested in confirming the Jewish origin of the Chueta population and also the different substrata of Ibiza Island that previous studies have indicated. The comparison between the evolution nuclear patterns (STRs and hematic markers) and the mitochondrial ones (RFLPs and sequence of region I) provides information about the differences in evolution taxa and also the dynamics of female-vs male mediated movement of DNA in Chueta and Ibiza populations. The study of diseases with a genetic study of myopia and otosclerosis in Balearic Islands. The patterns of inheritance of both diseases and their probable association with hematic markers will be determined with family studies. Also the existence of linkage disequilibria between STRs and disease genes will be tested.

Keywords: artificial reefs, coastal resources, artisanal fisheries, recruitment, protected marine areas.

Summary

The work which project we present intends to check “in situ” the results of artificial reef deployment in the littoral zone of different spanish coastal areas. The direct effects, in the short and long run, on the target species of the artisanal fleet and the relation of the artificial reef with the natural environment from the fish aggregation, response to fishing pressure, juvenile recruitment and sea bed regeneration points of view are studied. With it, we obtain knowledge on how the artificial reefs work, with the threefold aim of: 1º answer the questions the administration has now open in this respect, 2º obtain more basic scientific knowledge on the coastal artificial reef ecosystem and 3º contribute to the European Artificial Reef Research Network with data of our reefs to the whole knowledge on artificial reefs in the European Community.

Keywords: ecological status, water quality, macroinvertebrates, riparian forest.

Summary

The recent proposal of Freshwater Framework Directive (published in 27.2.1997; COM(97) 49 final) implies that member states of the EU should elaborate in the future maps of ecological status of their aquatic ecosystems, including rivers. The ecological status concept is mainly based in the qualification of freshwater quality using its biological components. The objective of our project is to study 10 mediterranean rivers in Spain where the establishment of their ecological status may present several difficulties due to ecological conditions of these rivers (droughts, flash floods). This fact means that methodological problems can be a bottleneck of the applications of these indices to mediterranean rivers and, therefore, studies have to be performed in order to solve these methodological problems. We propose to study 10 rivers basins in the mediterranean coast of Spain with the same sampling systems and data treatment. The result must help us to define an integrate index that using the biological quality of waters and the conservation of the riparian forest, allow us to classify the mediterranean rivers in the five classes of ecological status defined in the proposal of Freshwater Framework Directive. At the moment when the directive should be implemented, managers and policy makers will have a valuable instrument of water quality qualification in order to produce the ecological status maps. This system can be, probably, applied to many other Spanish rivers with minor changes.

Summary

During the last few years we have demonstrated that the plasma membrane lipid structure plays a crucial role in peripheral membrane protein-associated signal transduction [Escribá *et al.*, Proc. Natl. Acad. Acad. Sci. USA **92** (1995) 7595-99; Escrivá *et al.*, Proc. Natl. Acad. Acad. Sci. USA **94** (1997) 11375-80]. Recently, we have observed that monoinsaturated fatty acids (e. g., oleic acid) are able to regulate (10-50 (M) the interaction between some peripheral proteins involved in signal transduction and the plasma membrane, by modulating the physico-chemical membrane properties provided by phosphatidylethanolamine (unpublished results). Because the consumption of oleic acid is directly associated with a lesser incidence of tumoral processes (Farchi *et al.*, Eur. J. Cancer Prev. **5**, 113-120) and the antitumor drug daunomycin exhibits a similar effect to that of the fatty acid on the modulation of the plasma membrane structure and function, we propose a pharmacological and molecular study of this fatty acid to evaluate its use in onco-hematological processes, which could result in a similar use to that of trans-retinoic acid (vitamin A) for acute promyelocytic leukemia treatment. For this purpose, we plan two well defined experimental strategies. On one side, it will be performed an in-depth study on the molecular mechanism of interaction between oleic acid and the plasma membrane and its effect on plasma membrane-associated signals. This part of the study will allow a later design of new molecules with better pharmacological activity. On the other hand, it will be evaluated its therapeutic effectiveness in humans and its pharmacological efficacy in model systems (tissue cultures and laboratory animals). This study constitutes a complete evaluation of a molecule, from its molecular and cellular mechanism of action to the assessment of its pharmacological and clinical applications. The achievement of the proposed basic aims would mean the elucidation of the mechanism of peripheral membrane protein translocation, still unknown, and could result in important pharmacological consequences, derived of its pharmacological application to new therapeutic approaches involving the modulation of the plasma membrane structure and function.

Keywords: opioid drugs, morphine, heroine, metadone, tolerance, analgesia, pain, neurotoxicity, apoptosis, neuroprotection, cell culture.

Summary

The development of opioid tolerance (decrease in antinociceptive efficacy) is related to the activation of the N-methyl-D-aspartate receptor which induces increased cytoplasmic calcium levels in the neurone and activation of calcium-dependent nitric oxide synthase. It is known that this morphine exposure to cells induces apoptosis or increases their susceptibility to drugs that stimulate apoptosis. This research project is designed to assess the 'in vitro' effects of opioid drug exposure on the pathways related with neuronal viability, the potential neuronal damage after chronic 'in vivo' treatment and the relationship with the development of tolerance to the antinociceptive effect. The results of this study will help to design new approaches to reduce or protect from the potential neuronal damage after chronic opioid drug exposure and/or block or attenuate tolerance.

Keywords: *Drosophila suboscura*, haplotypes, mitochondrial DNA, linkage disequilibrium, chromosomal arrangements, DNA sequencing, biological fitness.

Summary

In most natural populations of *Drosophila suboscura* studied it has been found that there are two frequent haplotypes of mitochondrial DNA, I and II, which differ by a synonomous change in a target of the restriction enzyme *HaeIII*, as well as a series of less common haplotypes (less than 5%) that are different in time and location. The results obtained up to now have not solved yet the populational dynamics of these haplotypes in nature, and, although a superiority of the haplotype II over I in populational cages was initially found, this result has not been confirmed in current experiments. The cytonuclear disequilibrium experiments with haplotypes and enzymatic nuclear markers have not been significant. On the contrary, the association with chromosomal arrangements seems to be so. The hypothesis we are carrying out now is that in order to explain the presence of the most common haplotypes and the less frequent ones in nature, this must be studied from a population-genetics, ecologics and molecular point of view that could help to explain their dynamics. For this reason, in the present project we establish the following objectives: 1.- Annual dynamics of the mitochondrial haplotypes in a natural population of *Drosophila suboscura*. 2.- Effect of the environment on the haplotype distribution. 3.- Study of the fitness of the less common haplotypes. 4.- Reaction norm of the population cages with temperature. 5.- Association of mitochondrial haplotypes and chromosomal arrangements. 6.- Association of the mitochondrial haplotypes with nuclear STRs-like markers. 7.- Analysis of the nucleotide sequence in a 5 subunit region of the NADH dehydrogenase.

Keywords: prokaryotes, bacteria, extremely halophilic organisms, taxonomy, genomics, ecology.

Summary

This project involves a taxonomic, genomic, and autoecologic study of the new taxon *Salinibacter*, included in the Bacteria Domain. We have recently described the occurrence of such bacteria in crystallizer ponds from solar salterns of the West Mediterranean and East Atlantic. Unexpectedly, this bacteria accounted for up to 30% of the total prokaryotic population. *Salinibacter* is the first extremely halophilic bacteria which ecological importance has been reported. Additionally, its phylogenetic affiliation shows that is fairly remote from those bacteria described so far. In this regard, the combined study of physiology, ecology and genomics would help to imporve the understanding of the organisms belonging to the domain Bacteria, as well as the mechanisms of haloadaptation. Furthermore, given the extrmophilic nature of *Salinibacter*, likely the study of their physiology may lead to the recognition of new compounds of biotechnological interest.

Keywords: microbial ecology, littoral waters, microbial populations evolution, microbial community, molecular biology, pollution, hydrocarbons, oil and derivatives, geographical infomation system, GIS, remote sensing, data base, internet, natural areas management, environmental analysis impact.

Summary

Seas and oceans are masses of water that cover more than the 70% of the Earth surface. Their chemical composition is charactarized by, constant, lower amounts of solved organic compounds and nutrients. Exceptionally, offshore zones and coastal waters are areas showing high productivity, mainly due to its relative 'high' concentration of organic compounds and nutrients (due to surgery of nutrients and to the continental waters inflet, respectively). Anyhow, these areas are in ecological equilibrium, and they have 'climax' microbial communities. Human activity is able to dilute this equilibrium and thus, harbours and water treatment plant outlets are, for example, focus of oil and pathogenic bacteria contamination. Expensive and less-sensitive chemical analysis can be performed to detect and quantify this pollution. In this project we propose, using molecular biology, to characterize 'climax' microbial community of coastal waters and to analyze its changes in front of human contamination (harbours and water treatment plants effluent). Our aim is to use microbial community and its variations as sensors of pollution in coastal waters. Furthermore, we also propose to use remote sensing technology to study contamination levles and community changes in littoral waters. If both techniques, molecular microbial ecology and remote sensing technology, are able to show presence of pollution, we will posses two really efficient, sensitive, tools to determine the 'health' of a coastal water and to improve its management.

Keywords: genetic variability, biodiversity, *coleoptera*, endemic beetles, Canary Islands, laurel forest, mitochondrial DNA, PCR, DNA sequencing, phylogenetics, conservation.

Summary

The main goal of this project is to determine the effects of humid forest fragmentation on organisms with limited geographic distribution. We will use populations of carabid and tenebrionid beetles endemic to the Canary Islands as a model system. Also, we want to relate the historical (phylogeny and colonization patterns) and ecological factors (specialization to hypogean life and to different food resources) with the evolutionary success, genetic variability and population structure of these insects. The effect of the laurel forest regression on the decrease of biodiversity and in relation to conservation policies of this important habitat will be preferentially studied. To undertake these objectives, we will use DNA sequences of mitochondrial and nuclear markers obtained from individuals collected in populations of Tenerife, La Gomera, La Palma and El Hierro islands for population and phylogeographic analyses. This study should provide a basis from which to understand the genetic variability and biodiversity in a perspective of habitat fragmentation in insular ecosystems. We expect the results will have a broad application strategies in a wide number of organisms.

Keywords: imidazoline receptors, opiate addiction, MAP kinases, β -carbolines, neuroprotection.

Summary

The imidazoline receptors are novel ill-defined molecular entities, but with a great physiological/physiopathological and pharmacological/therapeutic potentials. The aim of this project (a follow-up of DGICYT 94-0002 project) are, on the one hand, to characterize and eventually clone these receptors, and on the other hand, to unravel their participation in opiate addiction and their interaction with endogenous β -carbolines. It is proposed to prepare various probes (mainly antibodies) directed against purified imidazoline receptors, which will be used to assess the cloning of these receptors through cDNA libraries and to characterize the molecular nature of these receptors. Moreover, it is proposed to study the effects of selective I₂ ligands on the MAP kinase signalling, in various models of opiate addiction, to assess whether these drugs are able to counteract the negative effects of opiate drugs on this signal transduction system. Finally, it is proposed to study the eventual participation of β -carbolines, as neuromodulators of imidazoline receptors, in the processes of opiate addiction. The results of this project will contribute to unravel the nature of imidazoline receptors and their involvement in the complex mechanisms of opioid tolerance and dependence, as well as the eventual potential of I₂-selective ligands as neuroprotectors.

Keywords: waste waters, water purification, trees, riverbanks, landscape restoration, purification efficiency, environmental quality.

Summary

The mediterranean basin is one of the world's sites where the recycling of waste waters is most advanced. The European Union is financing diverse projects in relation to this. On the other hand, there is intense activity at local level correctly manage and recycle such scarce resource as water. The Dendropurification, as waste water improvement by means of trees, is a poorly tested method which may be applied to tertiary water treatment and which also benefits the environment, landscape quality and water table levels. It is thus of special importance to areas dedicated to tourism. This project propose the use of secondary waste waters for the restoration of temporary streams and drainage ditch banks with autochthonous trees previously selected for their capacity for purification. Seepage waters, where levels of pathogenic microorganism are reduced by the filtering action of the soil and nutrient salts by root uptake, will reappear in the watercourses or replenish the water table with an improved quality. This general objective will be structurated in two ways: firstly by an analysis under controlled conditions of plant growth and ion accumulation, particularly CL, Na and nutrients and secondly by a study of nutrient cycling applied to different tree species combinations growing in either restored or field environmental conditions.

Keywords: food additives, detection, differentiation, identification, molecular, DNA, PCR, E410, E412, E417.

Summary

For food additives E410 (locust bean gum) and E412 (guar gum), we have previously developed molecular methods for the extraction and PCR amplification of DNA of the plants from which they are extracted. This allowed the direct identification of these two additives on their commercial preparations (patent pending). These methods are based on the identified existence in the genomes of these and other plant species of highly repetitive sequences with a high degree of variation between species of the same genus. Following the same molecular strategy, we will here determine diagnostic DNA sequences for food additive E417 (tara gum) extracted from the plant *Caesalpinia spinosa*. They will be applied to the differentiation of this food additive from the other two in raw materials (i.e., commercial food additives and their mixtures) and to the identification in foods of additives E410, E412, and E417. These goals match with objectives 9.2 of the Programa Nacional de Recursos y Tecnologías del Plan Nacional of the Spanish Government and 6.2 of Methodologies for Measurements and Testing from competitive and sustainable growth programme of the European Commision. Both objectives aim to develop new molecular analytical tools to ensure the origin and authenticity of raw materials and food ingredients.

Keywords: new technologies, teaching, applications in remote servers, molecular biology, DNA, RNA, proteins, 2D and 3D structures of biologically relevant molecules.

Summary

The application of new technologies to the teaching of undergraduate *curricula* and Ph. D. courses is a relatively new field in which the Universitat de les Illes Balears (UIB) has gained a relevant position, within an Autonomous Community which is on the forefront of this field. In the molecular biology area, meant as a multidisciplinary field with technological applications in the classic areas of Biology, such as Microbiology, Cell Biology, Genetics, Biochemistry, Plant Biology, etc., a new concept known as Bioinformatics has born in the last years. This new area assembles those hardware and, in particular, software resources applied to the study of Biology. A typical example of these applications are the building and management of large databases of DNA/RNA and protein sequences, as well as of crystallographic coordinates of biologically relevant molecules. This project aims to build up at the UIB the basic bioinformatic resources and their application to the teaching of molecular biology within the fields of Cell Biology, Microbiology, and Genetics at the Ph. D. level. These basic goals will be of application in the future at the undergraduate level. The bioinformatic resources generated as a consequence of this project will be organized in the form of an online course in the UIB Internet server, and it will be fully accessible from the web. An obvious advantage of the proposed structure of this course is that it will be used within ongoing teaching initiatives in the UIB, like the noclassroom teaching project *Campus Extens*.

Keywords: cheese, whey, -lactalbumin, -lactoglobulin, lactoferrin, lactose, acid lactic, bacteria, lactate, environmental contamination, depuration, ultrafiltration, reverse osmosis, FPLC, antibodies, ELISA, pathogens, bacteriophage, acid lactic fermentation, whole cell mass, food technology, dairy industry, food industry, animal feed supplement.

Summary

Cheese making is a fermentation process with long history and that allows the preservation of the nutritional value of milk. In cheese making only 10% by weight becomes cheese, the rest is an industrial waste stream (90% of the milk volume), whey. This effluent has a high organic content (mainly protein and lactose) that, accounting to current laws, has to be eliminated before its disposal. Anaerobic and aerobic treatment of whey is a possible solution to the contamination problem that represents whey from cheese. However, the qualities of the main proteins from whey ((-lactalbumin, (-lactoglobulin, BSA and Lactoferrin) such as gelling, water retention, emulsification, foaming and antibacterial capacity, as well as the high lactose concentration, make whey a product with high potential to be used in industries such as feed, meats, dairy and pharmaceutical. In this project, we propose to study the biochemical and microbiological quality of whey using molecular and traditional techniques with the objective of evaluating its particular potential in the above-mentioned industries. We will apply experimental models in the laboratory to process whey produced locally and evaluate its commercial potential. Finally, based on the generated data, an assessment will be made on the possible technological and economical potential of whey within the community of Balearic Islands.

Keywords: composting, compost, sludge, microbiology, analytical chemistry.

Summary

The aim of the composting process is the reduction in volume of solid organic wastes, and its transformation in a stable product to be used in agriculture, gardening or forestry. Compost quality is influenced by the starting substrate, the efficiency of the process and the consistency of the product. Quality is measured basically by the absence of heavy metals and the absence of pathogens. The physical, chemical and microbiological characteristics of starting materials, process and product will be studied. Main objective is the characterization of the process to ensure a compost of good quality. Traditional microbiological procedures, together with techniques used in molecular microbial ecology, will be used to characterize the microbial communities. At the same time, the physical and chemical parameters will be determined to favor the metabolic processes in each phase. The time needed for the process can be shortened optimizing the microbial activities. Taken all the results together, the standards of quality for the application of the compost in the Balearic Islands may be established. The knowledge gained during the study can be transferred immediately to the industrial sector. It will be applied very soon, due to the new local directive for the treatment of urban refuse in the Balearic Islands.

Summary

Respiratory infections caused by *Streptococcus pneumoniae* and *Klebsiella pneumoniae* are particularly common in patients with certain underlying conditions (i.e. COPD). These patients are more susceptible to these infections, but the reasons for their susceptibility are not clear.

Objetives: to study two aspects involved in the predisposition to bacterial respiratory infections of certain patients: the expression or upregulation of a bacterial virulence factors (i.e. capsule polysaccharide) and the immune response.

Metodology: we will investigate whether the cellular or environmental conditions of the lungs from these patients enhance the production of the capsule polysaccharide, the most important virulence factor of these pathogens. For this purpose, we will study in constructing transcriptional fusions between the promoter regions of the capsule genes and the CAT reporter system using representative strains from both microorganisms. In addition, we will compare the humoral and cellular innate immune response of patients with infections by *Streptococcus pneumoniae* and *Klebsiella pneumoniae* and of healthy controls to identify the predisposing factors leading to those infections. For this purpose, we will characterize the deposition and degradation of complement, and the resistance to opsonophagocytosis and to certain antimicrobials of the bacterial isolates from patients. These experiments will be carried out both with serum and immune cells from patients and healthy controls.

Keywords: obesity, thermogenesis, cell differentiation, adipocytes, brown and white adipose tissue, UCP, uncoupling proteins.

Summary

This project comes from our accumulated experience in the subject of facultative thermogenesis, both at the molecular and the cellular levels. We are intending to obtain new insights into the obesity-related genes, focusing on adipocytes and thermogenesis and their physiological significance in relationship with obesity and its metabolic complications. Our current goal is to delineate the properties of some essential nutrients and related products as potential regulators of the thermogenic activity and cell proliferation/differentiation, particularly of brown and white adipocytes. For such studies, the pre-selected nutrients include: essential fatty acids (linoleic acid, arachidonic acid),

retionic acid (all-trans and 9-cis) and several carotenoids related to vitamin A, butyric and hydroxybutyric acid, vitamin D3 and the amino acids tryptophan and arginine. The action of these compounds is to be studied both in systems *in vitro* (isolated adipocytes, adipocyte primary cultures, immortal adipocyte cell lines) and *in vivo* in rodents, including animals with dietary-induced obesity and nutritional deficiencies. The parameters to be determined include: thermogenesis (heat production, UCPs levels, GDP-binding), cell proliferation (protein and DNA content, cellularity, DNA synthesis) and cell differentiation (morphology and levels of molecular markers of the brown and white adipocyte differentiated phenotype, such as triglycerides, LPL, C/EBP α , ap2, pRB, β adrenergic receptors, leptin and its receptors, TNF and others). Besides, and through collaborations with other research groups, the polymorphism of genes potentially involved in body weight control in relationship with obesity and its clinical complications will be studied in human populations.

Keywords: sleep, evolution, cardiorespiratory regulation, neonates, reptiles, sudden infant death, spectral analysis, nonlinear analysis.

Summary

This study aims at understanding the origin and the functions of the REM sleep by analysing the cardiorespiratory regulation in reptiles and neonates. This will be performed by using non-linear analysis techniques that seems to overcome the limitations of the linear techniques with regard to EEG sleep studies. Cardiac activity, respiration (frequency, amplitude, pauses) and EEG will be studied in both reptiles and new-borns. Data will be recorded in reptiles by using chronically implanted electrodes, while disk adhesive electrodes will be used in the new-born. The obtained signals will be stored in a computer for further analysis. The obtained results will be used to develop evidence of homology between reptilian rest and human sleep states. It has been claimed that the reptilian respiration shows many characteristics similar to that of the foetus and neonate. In addition it is well known that this physiological variable deeply depends on the vigilance status, with an increased vulnerability during REM sleep. In consequence, the results obtained in reptiles could contribute to increase the knowledge on the cardiorespiratory pathologies in the new-born: periodic breathing, distribution of apneic pauses and their determining factors, irregularity in cardiac frequency, asystolia, sudden infant death, etc.

Nom total d'investigadors de la UIB: 15.

Keywords: obesity, thermogenesis, leptin, UCPs, obesity genes, mitochondria, regulation by nutrients.

Summary

This co-ordinated project is aimed to contribute to the knowledge of the genetic and molecular bases of body weight control and obesity. In the last 5 years, basic research in this field has lived a bust, with milestones such as the cloning of the ob gene and the identification of its products, leptin, as a key hormone in the control of food intake (as well as thermogenesis) through the CNS, and the decoding of the thermogenic systems, which determines the energy efficiency of nutrient metabolism. Our group, with a continuous interest in the field dating back 15 years, has been at the centre of this huge activity. Among our more recent contributions are: 1) the discovery that some nutrients can regulate the expression of genes related to thermogenesis and obesity, 2) the discovery of an association between certain gene polymorphisms and obesity and 3) the discovery that leptin, which is produced mainly in adipose tissues, is also produced in the human stomach (results in press). These contributions are the foundations of three of the subprojects presented here, the goals of which are: to further study the effects and mechanisms of action of already identified regulatory nutrients and to identify new putative regulatory nutrients, to establish possible associations between new gene polymorphisms and obesity and to investigate the possible role of leptin as a short-term satiating signal, characterising leptin expression in the gastrointestinal tract. In close association, another subproject deals with the study of the molecular and physiological bases of the sexual dimorphism in the regulation of thermogenesis and the mobilisation of fat stores, which has been previously reported by our group and could be related to the well known gender differences in fat distribution. Finally, two subprojects go further in the characterisation of the distinct thermogenic capacity and activity of the different mitochondrial subpopulations, and its possible implication in body weight disorders. This project is connected to other European activities, since, with complementary objectives, we have already established collaborations with the most important groups in the field, in the framework of COST action 918 (participated by 17 European Countries and managed by the co-ordinator of the present project) and of other projects requested to the V Framework Programme. This co-ordinated project is the natural continuity of our previous efforts in a field that has a great and increasing scientific impact, as well as important economic and social implications.

Keywords: bullying, mistreatment, intimidation, groups of equal.

Summary

The objective that we outline us in the present investigation is the analysis of the characteristics of the mistreatment and intimidation among equal, more known as “bullying”, their extension, and their consequences from an educational point of view. In fact, one of the most meaningful phenomena than they are being developing within the different means and educational spaces is the mistreatment among equal. In this sense is intended by a part to know the reality of the bullying within our educationa contexts, such as the scholastic context of functional households, the context of the juvenile leisure centers, etc, and on the other hands to accomplish a theoretical review on the state of the issue of such problematic. All this with the purpose last of power to establish, to design and to apply social and educational intervention strategies of the studied population and of the commissioned professionals of your education, that is to say, teachers, social educators, directing of center, scholastic psychologists, scholastic direction equipment, families, etc.

And finally, we intend to develop a permanent investigation line that permits to go knowing the characteristics and evolution of this phehenomenon, as well as the efficiency of the used intervention strategies, establishing indicatory of evaluation.

Summary

The basic objectives of this project refer to the correct use of the Information and Communication Technologies in the teaching and learning process. And more exactly in the Campus Extens project of the University of Balearic Islands. Campus Extens is to offer masters, postgraduate courses and inservice and preservice education to people of Menorca and Ibiza through videoconference systems, hypermedia distributed materials, computer mediated communications, etc.

In this context is planned the identification of the correct integration of the telematic tools in the education and teacher training. Refers to the organization of a methodological system to implement a tele-teaching system of the Campus Extens, the design and development of materials and the validation of methodologies and pedagogic models.

Keywords: transition, handicapped, occupational integration, social integration, quality of life.

Summary

At present nobody questions that the occupational integration of the handicapped persons is an indispensable requirement for the full normalization. Equally, nobody casts doubt on that the adequate professional training, promoting to the maximum the capacities of the handicapped persons, it is the key to improve their situation in the occupational world and consequently the social integration. Nevertheless, in spite of the training proposals adopted by the educational system, exists a vacuum and discontinuity among the obligatory education and the different formative itineraries that prepare for the active life. This study not only intends to analyze these itineraries but also to outline action proposals in order to adjust the formative offer that make possible that the handicapped persons dad could live a so full life as to them will be possible. As well as in the different educational stages is underlined the importance of a comprehensive curriculum in the professional training of handicapped persons this conceptualization acquires, if fits, a special relevancy. First of all because the transition process to the adult life must answer to a detailed planning and coordinated by an interdisciplinary equipment, on the base of an individualized approach of a needs of handicapped persons. From the premise of the fact that only as of a professional training of agreed quality to the characteristics and possibilities of the handicapped persons is possible the integration of these in the occupational market, the position of this investigation has as end last to guide the work of the professionals towards the community integration of the handicapped persons.

Summary

From 1300 permanent taxation began in the kingdom of Mallorca. Whether called *sisas* (shaving) or, later, *ajudes* (aid) indirect taxes became from the beginning the fundamental option in the municipalities' tax strategy. But indirect taxes proved maladapted to the challenge of the great Mediterranean upheavals of the mid-14th century. Public debt, instituted as an emergency solution, ended up devouring all the municipalities' resources.

Summary

The aim of this present research project is to do a systematic study of altarpieces in Majorca, between XVIth and XVIIIth centuries from an interdisciplinary point of view. For this purpose we analyse some artistic aspects such as (stylistic evolution, arhivistical localization, bibliographical and graphical sources). In the same way, identification of the material used for the construction of their paintings (stratigraphy of the pictorial layers, identification of their mineralogical components and nature of the binding media used) will be determined.

Summary

Studying the reign of Philip II in Mallorca involves investigating in depth a series of fundamental topics in order to be able to understand fully the evolution of society and the way of life during that area. Amongst these topics we highlight the following:

1. The system of government and the types of ruling power of the time: the privileges of the kingdom, royal administration and that of the University and the institutional reforms which took place.
2. Economic activities: demographic evolution, the agrarian problem, manufacturing activities and business relations, as well as the complex web of taxes and finance.
3. Defence and protection of the realm in the face of moslem pirate attacks.
4. Violence and internal social conflict, with special emphasis on the outlaw problem.
5. The Church and religious feeling at that particular crossroads marked by the conclusion of the Council of Trent.
6. Cultural life: the "Estudi General", "Lulismo", history and literature.

Keywords: social history, local politics, life conditions.

Summary

The aim of the project is the analisys of local politics (city and village) in terms of providing services to change the conditions of urban life (water-supply networks, sewerage systems, illumination of the streets, construction of hard pavements, removal of human waste, schools...). We want to test the creation of those social services before the rise of Welfare State, to link this policy to the growing of urban population, and to look for its ideological background. Finally we want to observe if there is any kind of relation between the growing exercise of civil rights and the increase of those services. We compare urban and rural settings in a context of agrarian development, in Mediterranean Europe.

Keywords: history, architecture, urbanism, tourism, legislation, balearic islands.

Summary

The main objective of this research project is the study of the effects of the touristic phenomenon in the architecture and urbanism of the Balearic Islands - Majorca, Minorca, Ibiza and Formentera- between 1900, date in which the majorcans begin to realize the economical value of the touristic explotation of the islands, and 1983, date of the approval of the "Plan provincial de ordenación de Baleares" (Provincial urbanistic plan of the Balearic Islands). We pretend to study two things: 1. The hotel and residential buildings from a typological and stylistic point of view; 2. The proposals and carrying out of the new touristical sites, both in the context of the historical development of the local tourism, and taking into account the evolution of the architecture and urbanism as well as the local and welfare estate dispositions and norms which have regulated them.

Keywords: majorca, medieval history, iconography, documentation, dayly living, archaeology, cultural history.

Summary

The combination of different methods of investigation makes possible the intention of obtaining a documentary vision, archaeological and iconographic, of dayly living in a concrete period of the history of Majorca (XIII-XVI centuries). That was a period of special importance, inasmuch as it meant the integration of the island in the Christian ambit (1229). It involved an evident cultural change. XIII and XIV centuries meant the full immersion in the european medieval culture, while the XV century. Although the social and economical problems linked to the period, was the prelude to the access to the new renacentist mentality.

Summary

This research project is devoted to solve two main questions. 1) To compile systematically, and at the same time, selectively all kinds of sources -bibliographics, documentaries and graphics- related to the working, theory and criticism of Plastic Arts and Photography made at Balearic Islands between 1890 and 1980. 2) The artistic products research begin by choosing the most representative episodes and also the worst known of them belonging to this period. Together to this we also accomplish the task of contextualize the different artistic languages used. Two significative examples are the Modern Style and the art of the 70's. In short, this research try to developed a historical-artistic point of view, nowadays non-existent, from the work on two areas, concerning, in one hand, to document and cataloguing, and in the other hand, to analyze artisitc products.

Keywords: Balearic Islands, palaeoecology, biogeography, prehistoric societies.

Summary

The project aims to establish the impact that prehistoric groups with different degree of development have had on the insular ecosystem of the Balearic Islands. One of the main goals of the project will be to ascertain the principal changes that have occurred in the local vegetation through time, including how the introduction of domesticated species has affected the existing flora and how these plants have been cultivated. Another important aspect of the project is to determine when domestic animals were introduced in the islands, to study the development of stockbreeding throughout prehistory (c. 6500-2000 BP) as well as other complementary subsistence means (fishing, hunting and gathering). The project will also focus on the use of non biological resources, their transformation, supply and exchange.

Keywords: Altarpiece, sculpture, painting, polychromy, pigment/binding media determination, FTIR, SEM, TG, DTA conservation/restoration, catalogue/finger-prints of works of art.

Summary

The proposed research project establishes a line of continuity with a project which is actually being carried out in the scientific-technical study of alterpieces in Majorca during modern times, in this case incorporating statues is a specific object of study and extending the chronology to medieval times.

The main aim of this project is, with an interdisciplinary approach, to draw up scientific-technical bases for the conservation of altarpiece and statue heritage in Majorca, which corresponds, to medieval and modern times. With this in mind we propose a scheme based on the conservation and restoration of a series of works by means of dialogue between art historians, archivists, chemists and restorers which would enable us to establish a diagnosis before hand and to supervise all the processes related to the protection of the art heritage studied all included at the memory.

Keywords: demographic transition, health transition, infant and child mortality, education, Mallorca 19th-20 centuries.

Summary

The analysis of Demographic Transition in Spain shows differences in demographic behavior among the spanish provinces. The Balearic Islands is one of the provinces where the transition seems to be quite early, specially concerned with the decline of infant mortality. The aim of the project is to follow a way of research in order to establish the causes of this decline. Diffusion of medical innovation is one of the factors to be analized. Thereafter we are going to consider health conditions, medical knowledge, and education as the most significative features of that historical process. To undertake the project we shall first establish when and how appear medical innovations in the field of hygiene and health, and when and how appear new education institutions (privates and publics). Secondly, we are going to analize specific infant mortality rates in relation to medical and education institutions. We consider a sample of urban and rural population of Majorca from 1860 to 1931.

Keywords: algebraic transformation, HLR systems, hypergraph rewriting, partial algebras.

Summary

This project is aimed at contributing to the study and application of algebraic transformation (at different levels of abstraction) in the following aspects:

- i) Determining missing HLR conditions for High-Level Replacement Systems, and studying High-Level Replacement Systems in the single-pushout approach.
- ii) Completing on-going work about algebraic transformation of hypergraphs and arbitrary partial algebras.
- iii) Applying results obtained in the previous points to term rewriting, object-oriented specification, and specification of hypertext systems.
- iv) Implementing the new approaches to hypergraph transformation in appropriate software tools.

Keywords: WATM, WMAC, WDLC, SDMA, intelligent antennas, security.

Summary

The primary goal of the DREAMS project is to specify and implement a WATM network demonstrator that will provide QoS support for mobile multimedia services, such as e. g. video conferencing, video on demand, etc. The protocol stack of the proposed WATM network will be fully harmonized with that of the standard ATM. The basic idea consists on the integration of physical (PHY) (based on the use of adaptive antenna arrays), media access control (MAC) (based on SDMA), data link control (DLC) and network control sublayers, specific on radio link, in the ATM protocol stack. Mobile terminal migration related functions, such as e. g. handover control and location management, and security management related functions will be handled through mobility/security support extensions in the control and signalling ATM protocols, implemented at the base station and wired network switching systems. Because the project deals with a new technology, the original system specification might have to be modified even during the final implementation phases. Therefore, the demonstrator platform will be designed to be as flexible as possible. The DREAMS demonstrator will contain six subsystems, namely two mobile terminals (TM), two base stations (EB), ATM switch and control station. This architecture allows for the implementation of two radio cells and, therefore, allows for the evaluation of handover protocols. The radio links and, thus, the integration of physical (PHY), media access control (MAC), data link control (DLC) and network control sublayers with the ATM protocol stack, will be simulated using standard DSP (Digital Signal Processor) boards controlled by using either PCs or a workstation.

Keywords: performance modelling, simulation, queueing networks, petri nets, fault tolerance, distributed systems, object orientation, client-server systems.

Summary

Distributed systems habitually work in real-time environments mainly soft and sometimes hard. A real time environment has associated characteristics affecting performance as well as fault tolerance. CORBA (Common Object Request Broker Architecture) is the standard proposed by the *Object Management Group* (association in which there are software houses, integrators and users) in order to have a common framework to ease the development of object-oriented client-server systems. However, this standard does not have any help for the designer of object-oriented client-server soft real-time systems (those that most frequently appear in applications). Real-time characteristics include performance and dependability aspects. The goal of this project is to develop a proposal to enhance the CORBA standard with the definition of the quality of service required by the user and with the aspects to be covered to ease the task of the client-server system designers. So, it will be necessary to analyse performance characteristics by means of queuing networks or Petri nets as well as the algorithms to be included in CORBA to manage the tasks of admission control, traffic shaping and policing congestion control. In the dependability domain, it will be necessary to study the dependability and, so the software system reliability maintainability and availability by means of Markov chains and Petri nets. For these analyses and the later algorithms implementation it is very important to have tools allowing shortening computation times. Also, for running these systems it is needed physical elements with an appropriate level of fault tolerance; so it will be necessary to develop techniques allowing the design and the enhancement the fault tolerance aspects of such systems.

Keywords: digital image processing, human motion, computer animation articulated systems, 3D-matching, stereoscopy, biomechanics, 3D-tracking.

Summary

The project goal is the design of a system that allows modelling, analysis and simulation of human movement by using new techniques that functionally combine digital image processing over image processing sequences, with articulate structure modeling mechanisms, on a computer. This project attempts to be the basis for a modular system where the current and future main techniques can be geared in a common environment to carry out analysis and synthesis. Current analysis for subjects on some domains of application (sportive performance, choreographic or medical analysis, etc) show the need of complementary mechanisms. Manual methods used nowadays are subjective and its reliability depends on the operator. Semi-automatic methods based on optical markers whose information is later processed as stereoscopic images carry additional problems: markers occluded by mobile body parts, and the need to establish a matching between the surface where the markers are, and the articulation whose movement is analysed. In addition, they constrain the application range of the system by interfering with the subject to be evaluated. We proposed for this project the use of a biomechanic model built on a hierarchical and articulated structure. Correlation between each of the structural elements

of the model is established with the analytical features of the stereoscopic images obtained from time synchronised cameras. To allow a wide range of application, subjects are not required to carry optical markers or special clothing, although usual constraints are imposed to the background (static or uniform, constant illumination, etc).

By using several algorithms and techniques for digital processing of image sequences at different scales, we will get a set of analytical objects (points, segments in movement) that combined with the biomechanic constrains will allow us to track, identify and match the parts of the synthetic model with the body poses on the different views.

From the synthetic point of view, the system will allow generation of scenes that have not been previously filmed. This comprises modeling and animation of several parts of the human body, including deformable models and simulation of mechanical systems applied to human body.

The graphical environment description and the programming methodology are defined in such a way that it is possible to interactively generate by high level commands, a sequence of movements either real or synthetic. Besides that, the routines and libraries delivered will be portable and reusable according to an object oriented programming methodology. Thus there is a subsection on development of reusable software using the appropriate tools, at both methodological and implementation levels. Finally, in coordination with the Robotic Group in our department and with others projects, it is possible to use these results on industrial environments applications with robots and people in movement to guarantee the safe interaction among them.

Keywords: informating processing, images, vision, algorithms, movement, compression, medical applications.

Summary

The aims of these project are:

- 1) From the description of the image given by the topographic map and the junctions in T, we try to extend this concept to the image movement, and, on the other hand, to define the topographic map of colour image. The applications will be given to follow the objects in a sequence of images, and, in the colour images, to give a compression model of the image from the structure of the topographic map.
- 2) The reconstruction 3D of the objects of a scene from two or more images taken on the scene. The model we suggest is based on the idea of evolution of curves of surfaces, the active contours. The medical application we pretend is the 3D reconstruction of the veins and blood vessels from two angiographies images.
- 3) To developp the corresponding software of these projects and integrate it in a software platform with a friendly user interface which allows a more generalized use of it.

Summary

The aim of this project is the study and development of an autonomous underwater robot, mainly through for carrying out programmed tasks in sub-sea environments. The main goal is to deal with local image processing applied to inspection tasks as well as to collect biological samples for research and environment supervision. On the other hand, such an explorer vehicle will operate like a slave of the teleoperated robot already build up by our research team (Garbí project), which is provided by two articulated arms, and able to carry out, from the outside water, a great number of specific tasks. However, its physical link, by means of an umbilical cable, constrains its explorer capabilities. So, the whole system composed by an autonomous explorer vehicle and a teleoperated one (which could work from the supplied information by the first one) can be considered an intelligent master-slave robot system of a great scientifically and technological interest, specially for its high possibilities concerning industrial applications.

Keywords: biomolecular computing, rewriting systems, fuzzy logic, cryptology.

Summary

Biomolecular computing is the computing paradigm where information is encoded in nucleic acid and protein molecules and is processed by means on biochemical operations on these molecules. The goal is to contribute to the following three aspects of biomolecular computing:

- i) The development of formal rewriting models of the nucleic acids' and proteins' non-linear structure.
- ii) The analysis of biomolecular computing processes by means of fuzzy logic and the implementation of different logic and arithmetic gates within this paradigm.
- iii) The use of biomolecular computing in cryptology.

Keywords: infant mortality, health conditions, education, quality of life, economic development.

Summary

This project develops the findings of a previous one (Health, education and culture as factors concerning the decline of infant mortality, Mallorca 1860-1930), by the analysis of the geographical patterns of infant mortality in two different contexts: the city of Palma (and inside the city too) and the rural area of Mallorca. Next, we shall relate those patterns to the forms how medical care is organized, as well as health, education and hygiene services, making a distinction between Palma (and within Palma), and the rest of the Island, as well as between public and private services. One of the aims of the project consist on to test if the supply of public services is more relevant than the economic growth, regarding the infant mortality decline. And also, to see the proportion of population with the capability to enjoy the benefits of these services. We can work with a set of data from the previous project, but it is necessary to enlarge it with more information about the city of Palma. Besides, we are going to get more data on demography, health, education and hygiene questions.

Keywords: aggregation functions, t-norms, uninorms, t-operators, means, multi-dimensional, aggregation functions, discrete measures and integrals, generalized natural numbers and fuzzy numbers, functional equations, functional equations related to idempotency, distributivity and modularity, measures of dispersion, optimization, fusion of information.

Summary

In this project we intent to give a new impulse to the theory and applications of the Aggregation Functions, meaning functions/operators which allow to (functionally) modelize the action of “aggregating” several inputs in order to produce a unique output. In the same way, it will be strengthened the use of technics for solving Functional Equations to obtain solutions to problems derived from the study mentioned above. It is worth to emphasize our interest in finishing the study and characterization of associative aggregation functions (like t-norms, uninorms and t-operators) defined on ordered sets, as well as non-associative ones (like quasi-linear menas and weighted ordered means) defined in various domains. In particular, previous studies related to (non-associative) aggregation functions of a multi-dimensional nature are going to be finished, as well as the study of discrete measures which determine (non-associative) aggregation functions with interesting properties through integrals (like Choquet or Sugeno). With regard to applications, it is intended to obtain final results corresponding to the determination of aggregation functions like weighted means with maximum dispersion (entropy) of its weighting list, subjected to restrictions which can be related for example to a degree of optimism ('orness'). In this section, it will be dealt as well with the practical problem of the fusion of imprecise information through the aggregation of fuzzy numbers, in particular of those representing generalized natural numbers.

Keywords: climatic change, rainfall, temperature, Balearic Islands.

Summary

The main purpose of the project is to analyse the climate changes in the Balearic Islands. The study will be performed starting from the date of the first data systematically recorded to nowadays. It will be applied an statistical study to detect the scope of the climate change in a regional scale. The differences between islands will be specially considered. The data analysis proces will include an statistical approach and a recognition of geographical patterns. The results of this analysis will be considered indicators of the climatic changes.

Keywords: carbonates, platforms, shelves, facies architecture.

Summary

The aim of this project is to establish the relationships between carbonate production, accommodation changes and facies architecture in four examples of carbonate platforms and shelves from the Cretaceous and Paleogene of the southeastern-Pyrenees area, upper Miocene of Menorca (Balearic Islands) and Plio-Pleistocene of Puglia (southern Italy). Carbonate production in these examples was related to different types of biota, clima and geodinamic context.

Keywords: speleochronology, geomorphology, sea-level oscillation, littoral karst, pleistocene, holocene.

Summary

Mallorca and Menorca are islands mainly integrated by limestone lithologies. They represent an adequate scenario for developing pluridisciplinary investigations focused on littoral geomorphology and, more particularly, on coastal karst morphogenesis. Several research programmes have been independently devoted in the past to topics such as the study of paleo sea-level related speleothems or the peculiar 'cala' -type landscape, which is one of the most characteristic features along the coast of the Balearic Islands. Within this framework, it is of interest to carry out an integrated investigation of littoral morphogenetic processes controlled by pleistocene and holocene Mediterranean sea oscillations; this would contribute to a better understanding of both the recent sea-level history and the geomorphological evolution of associated phenomena. The main subjects to be approached in the proposed project are as follows:

- Speleo-diving techniques aimed at sampling of the phreatic speleotherm alignments that record paleo sea-levels between +0 and -25 m below the current Mediterranean level.
- Isotope dating of the phreatic speleothem samples, in order to determine a eustatic curve that will provide data on negative sea-level stabilizations connected with cold climatic events.
- Correlation of the chronological data obtained on the geomorphological evolution of both littoral endokarst and fluvio-torrential systems which originate the 'cala'-type coast and the infillings associated with them.

- Localization, measurement, and dating of eolianite sets and the study of their karstic evolution in Balearic and Valencian coasts.
- Comparison between coastal morphogenesis on the Balearic Islands and in carbonate littorals of eastern Iberia, and establishment of common and/or differential trends in the tectono-eustatic evolution of both areas.

This research project will be an adequate means of bringing out substantial information on a poorly known topic in the study of the Balearic Quaternary: the lower paleo sea-levels, the chronology of the events, and its implications on the littoral morphogenetics of the islands in question.

Keywords: extreme temperature events, heat weaves, cold weaves, freezes, homogenised daily temperatures, gridded data set, spain.

Summary

The aim of this project is to analyse the spatial and temporal variations and trends in the occurrence of extreme thermal events in Spain and to estimate the high-frequency variability of the several spanish regions incorporated in the study. The first step will be the creation of a long-term high-quality and homogenised daily temperature data set (daily maximum and minimum temperatures). The spatial dimension of this work will be established through the combination of individual station records to generate a regional gridded data set. The analyse of temporal changes and trends in the frequency of extreme temperature events in the entire territory and in the different regions will ground on the initial establishment of these events in the entire territory and in the different regions will ground on the initial establishment of these events (heat weaves, cold weaves, number of days exceeding temperature thresholds). Estimations of variations and trends (total and partial) will be performed with several statistical techniques (lineal trends, low-pass filters, change point detection, etc). We will also study the characteristics persistence and intensity of previously established events, both for Spain and sub-regions, to detect different spatial signals in these events. Finally, we will examine its inter-seasonal and inter-annual variability to determine the modes of change that have influenced its temporal pattern.

Keywords: transport models, network modelling, gis development.

Summary

The aim of the project is the development of an informatic program built over a GIS oriented to the planning and management of the transport routes in the Balearic Islands. First, a data base will be created with information about educational centers (offer) and real demand (scholar population). Theoretic models of location will be developed in order to obtain the best routes of transport students. Finally the model will be translated to an informatic from and it could be applied to planning the scholar transport routes. Also the transport routes will be analysed and a second application build over a GIS will be developed to impove its management.

Summary

Our research project is aimed at studying the limits to the criminal and civil action upon the intellectual and industrial property rights exploited by telematic means and specially over the Internet. In order to do so, we need first to focus on the means through which this exploitation is conducted, which presents in itself several juridical problems due to a generalized *anomia* and the usage developed by web-operators. This study also includes the structure of the service providers as well as their responsibility regime. Once this first step is concluded, we will study the different domestic laws on the protection of industrial and intellectual property as well as on the protection of data and intimacy. Afterwards, we will focus on the several infringing conducts developed and the civil and criminal responsibility regimes applicable to them.

Summary

To identify the determinant of the competitiveness of the enterprises is a difficult task, besides other reasons because of the strong interrelations among them. The structure of ownership and the governance organisation, the role of the capital markets, the investment in intangible capital are aspects which have been insufficiently studied in the Spanish case. The proposed project has an objective the improvement of its knowledge. In that sense, it has a theoretical component to build a frame of reference - and an empirical one, to amass data and information following a more accurate diagnose.

Keywords: environmental valuation, hedonic prices, sustainable index.

Summary

The hedonic hypothesis tells us that goods are valued for their utility-bearing attributes or characteristics. From this hypothesis we can accept that the choice of a house depend on structural characteristics of the house, characteristics of the neighbourhood and the location-specific environmental amenities. Therefore, it would be correct to use metodologic instruments to the development of aspects of overall planning (territorial, urban and environmental) with the hedonic prices valuation technique. Then we will be able to value the significance of the environmental attributes, to specify the demand of these attributes to be able to value individual welfare changes when these environmental characteristics change and to rationalise the public policies and private strategies design with the help of sustainable index. To show the applicability of this methodology we will make a study of a tourist area of the Balearic Islands of residential tourism.

Keywords: quality management, ownership structure, environmental sustainability.

Summary

The present research project (which enjoys partial financing through DGES projects) proposes to undertake a detailed analysis of two complementary issues of great importance for the Balearic hotel (and tourist) industry. The project will analyze, from an empirical and theoretical perspective, the ownership structure and, more specifically, the contractual form and structure existing in the Balearic hotel industry. We propose to start doing an empirical analysis of the ownership structures and its contractual forms. To do so we pretend to use the infrastructure and resources (data, contacts,...) of CITTIB, doing also a detailed analysis of these contractual forms (including existing contract clauses) in the Balearic hotel industry. Next, we will undertake a theoretical analysis identifying the determinants (economic, legal,...) of the contractual structures, and its implications, both for hotel management and for the design of regulation and promotion of the Balearic hotel sector. The second research issue of this project lies within this context of analysis of hotel management and design of regulation: the study of environmental management systems (SGM). A crucial factor in the development and competitiveness in the medium and long term of the tourist industry (and the hotel sector) lies in the consideration by industry managers of environmental aspects, and SGM are part of it. Thus, the project aims at studying (from the double theoretical and empirical perspective) in line with Govern Balear projects such as ECOTOUR, the application of SGM undertaken until today by the Balearic hotel (and tourist) industry. This analysis includes considering the incentives (via product differentiation or cost reduction) which have hotel managers to undertake this application. This will allow providing specific policy recommendations with the goal of promoting an internalization by hotel managers of environmental issues. Both objectives are related to the extent that the design of competitive strategies based in the implementation of SGM are conditioned to the contractual form which relates ownership and management.

Keywords: environmental accounting, environmental management, tourism, sustainability.

Summary

The economy of the Balearic Islands depends in a fundamental way on the tourist trade. The protection of the environment and the achievement of a model of sustainable growth constitute real survival challenges for the tourist industry, as the quality of the environment of a tourist destination is a key factor in choosing among competing holiday destinations. This project intends to diagnose what the situation of our tourist enterprises is -in terms of facts and attitudes- with regards to environmental management, the incorporation of environmental variables into their accounting systems and their release of relevant information to the public.

The main aims of the project are:

- to find out about our tourist enterprises perceptions with respect to their relationship with the environment and the position they adopt as organisations;
- to research their attitudes with regards to the implementation of environmental management procedures and the release of relevant accounting information, as well as to assess the degree of their actual implementation;
- to analyse the environmental content of the external information made public by the enterprises;
- to apply the case study method to a concrete tourist municipality as a means to allow the study of environmental problems that go beyond the microeconomic level.

The study will enable us to detect the advantages and disadvantages taken into account by the enterprises, their resistance to change and the main difficulties. We will conclude with a realistic proposal that contributes to improve the implementation of standard systems of environmental management and accounting, with special reference to the European Union's EMAS System and the Decree of the Government of the Balearics which applies it to the tourist industry.

Summary

The hedonic hypothesis tells us that goods and services are valued for their utility bearing attributes or characteristics. From this hypothesis we can accept that the choice of an individual depend on structural characteristics of the services and on the quality of the environment which they take place. Therefore, it would be correct to use the hedonic prices valuation technique to approach us to the economic valuation that tourists suggest for the environmental attributes, which are relevant for the tourist activities of lodging. Then we will be able to value the significance of the environmental attributes in the choice of lodging establishments (hotel, apartment,...) to specify the demand of these attributes and to rationalise the public policies and private strategies in the tourists lodging sector. To show the applicability of this methodology we will make a study of a tourist area of the Balearic Islands.

Summary

Our research project aims to clarify and give analytical soundness to the current debate over the proper tourist development strategy for the Balearic Islands. We believe that this aim requires, as a first step, to analyse the sustainability of different tourist development strategies from a long-run perspective. In order to do this, we should consider the close dependence of the tourist sector on competitiveness factors other than the price, specially its dependence on the environmental quality. Our aim would demand several targets. Firstly, the concept of sustainability should be clarity. Thirdly, the previous findings ought to be used in order to evaluate different public intervention alternatives aimed at sustainability. As a second step, our purpose is to shed light on the possible transition and readjustment costs of a change in the tourist development strategy. We would focus on the short-run effects on the labour market coming from changes in the size and composition of the tourist offer, such us changes in wages and unemployment, mismatch between labour supply and labour demand and so on.

Keywords: critical edition, publication of unknown works.

Summary

The purpose of this project is to carry out a study, to catalogue and create a critical edition of unstudied and unpublished works of Bartolomé Jiménez Patón (1569-1640). This research stems from the discovery of some manuscripts, until now unknown, by various members of this team. Particular texts such as the *Cátedra de erudición*, *El virtuoso discreto*, the sixteenth volume of the *Comentarios de erudición*. An important part of this work is going to constitute in the study of works like the *Perfecto predicador* (Baeza, 1612) and the distinct works that the humanist wrote, till the end of his life, centered on his reflexion over the problems of his time, *Reforma de trajes* (Baeza, 1638), or *Discurso sobre los tufos, copetes y calvas* (Baeza, 1639), among others that are mentioned in this project.

Summary

The Welfare State has been questioned in the policies of a number of Western countries since the eighties, particularly in the United States, with Reagan and Bush, and in the United Kingdom, with M. Thatcher. This questioning has had a double presence, one in the practical world of everyday politics, and the other in the theoretical justifications of that view, based mainly on the works by Hayek and Nozick. Both one and the other have been upheld by the crumbling of the Eastern European Communist countries, leading to the view of the so-called "pensamiento único". This work, while reviewing the general outlines of this change, tries to examine the kind of social transformations resulting from that approach, and to relate them to the usual notions of justice which have been put in contrast.

Summary

The study of evolution in terms of grades has been proposed as an alternative to cladistics limits existing to interpret ancestor-descendant relationships. However, “grades” are widely grounded on functional assumption, thus being difficult to quantify. The current project tries: Firstly, to establish an interdisciplinary evolutive scenario of the main functional traits of *Homo sapiens* (such as, language, aesthetics, and morals). Secondly, to perform experimental studies to obtain stimuli capable of activating brain areas of processing of these tasks. Thirdly, to localize brain areas functionally active during the mentioned tasks, to check the hypothesis of a prefrontal localization of moral judgement, aesthetic appreciation and metaphorical using of language -the development of which would have been responsible for the late hominization period. Fourthly, to build computer simulated models of the evolution of the capacity of analyzing and culturing transmitting evaluations. Fifthly, to analyse some turning point on the cultural evolution. Finally, to set up a model on the phylogeny of the already mentioned functional traits. How to identify grades and clades in the fossil record was mentioned in the Colloquium “Taxonomy and Systematics of the Human Clade” (Palma, February, 2000) as an area of particular interest of research in face of the V Congress of the IAHP (Barcelona 2003). The participants agreed in organising an International Group of research in human systematics to promote that kind of studies. To reach a typification of the human grade is important in the systematics and paleontology fields, as well as in psychology, psychiatry, neurology, ethics, ethology, anthropology, biodiversity, and environmental studies.

Summary

It tries to continue the research on social changes in developed countries, focused, first, on theoretical general analysis and, second, on application to spanish society as well as balearic context. This analysis approaches on equity perspective. The analysis places on impact produced by globalization and complex modernity on social structure and welfar state. The emphasis is on social changes and citizenship rights. The contrast between factual changes and contra-factual equity assumptions allows to evaluate public policies, labour market and social exclusion from the double view of facticity and validity. This theoretical analysis finds the cuantitative and valorative evaluation of such changes in spanish and balearic context.

Keywords: sun, solar corona, prominences, magnetohydrodynamic waves.

Summary

The aim of this project is to improve the knowledge about the excitation and propagation of magnetohydrodynamic waves in solar coronal structures such as prominences, arcades, loops, current sheets, etc. The main goal is to obtain dispersion relations and diagnostic diagrams which wold allow to compare easily theoretical predictions with observational results. The study of the oscillations of the physical parameters of the system (velocity, pressure, magnetic field) will help to clarify the physical conditions of such system. On the other hand, the project contains an observational part, to be performed using ground and space based telescopes, which will provide information able to be compared with theoretical results. Besides the information about oscillations present in the system, observational data will inform about the physical properties of the studied structures which will allow to improve the theoretical models and, using such improved models, to obtain a better agreement between observational results and theoretical predictions.

Keywords: general relativity, gravitational waves.

Summary

The application of analytical techniques to the study of initial, boundary and gauge conditions in Numerical Relativity is proposed. Using these conditions, the proposal is to build up tridimensional numerical codes to describe compact objects (black holes and/or neutron stars). Using these codes, the proposal is to compute the wave patterns needed to improve, by using the matched filtering technique, the sensibility of the laser interferometer gravitational waves detectors (LIGO, VIRGO) now under construction.

Keywords: defect and fault modeling, integrated circuit testing, microelectronic design, sub-micron integrated circuits.

Summary

The state of the art of the microelectronic technologies has brought the capability of fabricating devices in the sub micron range. One of the characteristics of such as transistors is that they show leakage currents which are much higher than the levels drawn by devices in technologies beyond the micron. These currents may limit the effectiveness of test techniques based on monitoring non logical parameters, which have been shown to provide higher coverage in CMOS technologies with respect to logic based methods. The research proposal presented is oriented to extend the capabilities of one of the parametric test techniques most used (IDQ testing), to submicron circuits. The method consists in to consider both the static and dynamic parts of the current power supply, and use the charge driven into the circuit (the integral of the overall current) as the observable for test. Using the charge as the observable for test provides basically two advantages: it can be applied to circuits with a background leakage current, and may detect defects preventing current. These two main characteristics represent an extension of IDQ testing because it allows the detection of defects where IDQ effectiveness is poor, and also it can be applied to submicron ICs. The main objectives of the research proposed include a systematic characterization of the charge driven into non defective circuits to obtain a reference to distinguish between good and bad parts. Next, the effect of several faults on the charge behavior will be investigated, developing the required fault models. Of particular interest is the application of the technique at the circuit level, developing the heuristic required to obtain the input test vectors that sensitize the possible defects into the circuit. Additionally the design of specific circuitry to sense the charge will be considered. Finally the technique will be applied to commercial circuits to evaluate its practical effectiveness.

Keywords: martensitic transformation, shape memory, rapid solidification, melt-spinning, microstructure.

Summary

The characterization of Cu- and Ni-Ti-based shape memory alloys (SMA) produced by means of rapid solidification (melt-spinning, MS) constitutes the objective of the present project. Finished (or almost finished) products can be obtained by means of the MS technique, although some microstructural features, like small grain size, high vacancy concentration and incomplete atomic order, which influence the martensitic transformation responsible of the particular properties of SMA, are also introduced. The major number of applications, already developed or potential, use the Cu- and Ni-Ti-based systems. A special focus of interest is constituted by the SMA with high transformation temperatures (above 100°C) and good stability at temperatures 200-300°C, which limits the selection to the Cu-Al-Ni (with additions like Mn, B, Ti) and Ni-Ti-X (X=Cu, Hf, Nb). The MS ribbons already produced (in the frame of an european INCO project) show a good macroscopic quality, although its extensive and systematic characterization is needed. The work plan is divided in four topics: (1) Reproducibility and stability of transformation temperatures; (2) Ageing effects; (3) Thermomechanical cycling and (4) Superelasticity and DMA. These topics are closely related with the applications requirements and the results will also give information on processes like ordering, precipitation and defects generation, whose basic interest extends beyond the SMA field.

Keywords: fault modelling and simulation, test mixed A/D circuits, current consumption, sensors, stimuli generation, submicron technologies.

Summary

Testing is a crucial part in the design and production of integrated circuits. Its difficulty grows with the device dimension shrinking, the increase in the circuit complexity and with the coexistence of analog and digital parts in the same chip. In mixed analog/digital (A/D) circuits, testing analog blocks require more time effort, although the area of the analog blocks often smaller. The production of VLSI analog mixed A/D circuits has suffered a tremendous increase in the last years. But testing of the analog blocks is now the bottleneck in its future development. Therefore, test optimisation in mixed A/D circuits is a very active research field nowadays. Test optimisation requires better fault models than existing ones. The proposed work is oriented towards the creation of a realistic fault model dictionary in mixed A/D CMOS circuits, at high abstraction levels. These models will be incorporated in circuit simulators based on SPICE. The goal is to obtain fault simulation tools, easy to use and effective, oriented to test optimisation. These tools could be used by the teams devoted to test development in analog and mixed A/D circuits. The scope of the project includes experimental validation of the fault models developed, designing specific circuits for this task. Also the effectiveness of the input stimuli in revealing faulty circuits will be analysed.

Keywords: heavy rain, western mediterranean, numerical situation, climate change, downscaling.

Summary

The main aim of the project is the determination of the frequency and intensity of heavy rains in a modified climate scenario (towards the half next century) in the spanish area that, at present, is more frequently affected by these hazardous phenomena, the mediterranean coastal zone. The methodology will use numerical simulations, with the HIRLAM model, of the 165 heavy rain events identified during the decade 1984-93. The model, which will have the same resolution in all the experiments, will be nested in ECMWF analysis data. Different resolution of the ECMWF data will be used to nest the HIRLAM, in order to relate the results obtained using coarse or finer resolution by means of downscaling techniques. Such results will be used to improve the rainfall predicted fields for future potentially hazardous metereological situations given by a climate model for the decade 2051-60. Such situations can be identified by comparision with those observed during 1984-93 and from a control run of a climatic model. Applications are the knowledge of shuch hazardous phenomenon in the next future, with the same uncertainty that climate models simulate future atmospheric circulation. Results can be used for future hydrologic purposes and may be of interest for insurance and agriculture.

Summary

The Third International Mathematics and Science Study (TIMSS) is a collaborative research project sponsored by the International Association for the Evaluation of Educational Achievement (IEA). The TIMSS tested and collected information about students from 45 countries in three levels of the educational system. In 1995 Spain participated in the level 2, students enrolled in the two adjacent grades that contain the largest proportion of 13-years old students (7th and 8th school grades). TIMSS measured student achievement in mathematics and science through written tests with multiple-choice, problems and free-response format questions and performance tasks (just for a sub-sample). Moreover TIMSS gathered data (around 1500 variables) related to instructional strategies in science and mathematics, classroom activities, school characteristics, student attitudes and demographic characteristics, through questionnaires completed by students, teachers and school principals. The current project attempts to study and analyse Spain's TIMSS data, which portrays a major picture about the quality of science and mathematics education in our schools.

Keywords: magnetohydrodynamics, magnetohydrodynamic waves, solar activity, solar cycle.

Summary

Our proposal is based on a feed-back between theory and observation, our general goals being: (1) to use observational data to improve theoretical models; (2) to use the predictions of these models for subsequent observational campaigns; (3) to use theoretical models to reproduce the behaviour of solar activity in the past and to forecast its future behavior.

Two topics are included in the proposal: on one hand, we plan to study wave propagation within magnetic coronal structures and, on the other hand, to forecast and analyze the behavior of solar activity.

In the first part of the proposal, the specific goals are: (1) to study the effects of magnetic shear in MHD wave propagation in coronal structures such as magnetic arcades and prominences; (2) by considering quiescent solar prominences as slabs of material or composed by fibril structures, to bring a theoretical explanation to the observations of damping and growing of oscillations within them.

In the second part, we plan to study the behavior of solar and geomagnetic activity with the following specific goals: (1) to set up a forecasting method based on genetic algorithms, of the future behavior of the solar cycle and geomagnetic activity, based on genetic algorithms; (2) to analyze, using solar magnetograms obtained by ground-based solar telescopes and the MDI instrument onboard SOHO, the magnetic flux emergence during the recent solar cycles in order to confirm, or not, a hypothesis about the cause of the periodicity near 160 days in high-energy solar flares.

Keywords: shape memory alloys, smart materials, stabilisation, martensite, training, diffusion welding, microstructure, properties, guaranteed behaviour, rapid solidification, melt-spinning.

Summary

The main limitations of the shape memory alloys are the low transformation temperatures with the low stability of these temperatures and the structures involved in shape memory properties. To increase this transformation temperatures, a lot of people are working in complex Cu-Al-Ni-Ti-Mn alloys. The more complex the alloys, the higher the complexity of the degradations of the alloy at high temperatures. The aim of the project is to get shape memory alloys. It is also the scope of the project to get alloys with high stability of the transformation temperatures and phases. Hence the shape memory alloys can be guaranteed for industrial applications once improved the attainment and the processing to get, at the end, prototypes of industrial interest.

Summary

This proposal follows an ongoing line of research on dynamical properties of nonlinear, nonequilibrium systems as well as on the application of basic knowledge on this field to systems of interest in Photonics technology. It also contemplates an open line of research to address the construction of a Statistical Mechanics of spatio-temporal chaos (weak turbulence). Specific objectives to be addressed include the study of non variational aspects of the CGLE, fluctuations in the convective instability, the study of the vectorial CGLE and parametrically forced systems. Among the open questions in the study of spatio-temporal chaos we address the existence and characterization of transitions among disordered phases, universality classes, quantitative measures of spatio-temporal chaos and the stochastic description of collective behavior at large length scales. Among the applications we propose to solve problems of synchronization of lasers, characterization and control of filamentation in broad area semiconductor lasers and dynamics of polarization of the laser electric field.

Keywords: specific phobia, flying fear, software.

Summary

In spite of its prevalence, flying phobia has received much less attention than other anxiety and phobic disorders. The controlled flying treatment studies are few and have focused on "in vivo" and other exposure techniques. These techniques imply economic and practical problems which have had a negative impact on research. According to this, a new computer treatment programme has been developed by our research team. This innovative computer programme has been developed by our research team. This innovative computer programme is able 1) to reproduce fixed and animated images and realistic sounds, 2) to select, according to previous assessment results, a hierarchical stimulus exposure, 3) to control stimulus time exposure related to patient information. This project aims to assess the treatment efficacy of our computer programme and to compare it to other traditional intervention programmes which do not involve exposure.

Keywords: domestic violence, male batterers, perpetrator profile.

Summary

Domestic violence have been regarded an important social problem during last years. National and international institutions as well as scientist have been increased their concern about solutions of this issue. The perpetrator profile is one of the questions that have generated more interest, that means the sociodemographic and psychosocial features that differentiate male batterers from male non batterers. From this concern have been raised an amount of literature that have only give us provisional conclusions. The objective of the present study is analysing comparatively the perpetrator profile form a double view: on the one hand, a revision of investigations up to the date and, on the other hand, a comparative analysis (between male batterers and non-batterers) on their believes about women and women condition.

Summary

The research project has two main goals. The first aim is to know the characteristics of the patients with fear of flying that are the most relevant ones in order to predict the effectiveness of a computer-assisted exposure (CAE) treatment. The focus of the patient's fear, his or her before-flight anxiety level, and the intensity of his or her fear are the target variables of this research project. The second goal is to make available a self-administered version of the CAE treatment. Any company dealing with air passenger transportation (airlines, tour operators, travel agencies, tourism institutions, etc) could use the CAE treatment with those of their clients who show the personal characteristics found relevant by the research.

Summary

Research on service quality had pointed out the importance that user-provider interaction plays on users' quality perceptions, as well as the emotional aspects of that relationship. Moreover, for service organizations, and orientation towards service quality appears as a key aspect for providing good service and achieve users' satisfaction. Our previous research clarified some antecedents of service quality (expectancies, expectancies-perception discrepancy, equity). The present project tries to deep study some interesting questions opened by previous research. First, we will study the relationships that service orientation' climate (as perceived by employees), and burnout experienced by staff members has on users' perceptions of service received and equity in interaction with service providers. Second, the project analyses two different antecedents on service orientation' climate and burnout: the role that organizational climate as perceived by employees (measured as the FOCUS international research group had proposed: support, orientation toward goals, respect for rules and innovation) plays on service orientation' climate and burnout, on the one hand, and the role of different technological and organizational aspects (as training, computer support, remuneration, human resources policies), on the other hand. Finally, the project takes into account the emotional work performed by contact staff, a key element in tourism organizations where contact personnel determines in high degree the service provided. The study analizes the emotional work of contact employees (specially the degree of dissonance between the emotions that the job demand and the emotions that person would apply), and the reciprocity they perceive and their relationships with burnout, service orientation' climate and users' perceptions of service received. The sample consists of 60 hotels and 60 restaurants from Comunidad Valenciana and Islas Baleares (Spain), including sun and beach and cultural and city tourist organizations. The survey includes interviews with different employees for each hotel and restaurant and ten users interwiewed during the service provision.

Summary

The study of evolution in terms of grades has been proposed as an alternative to cladistics limits existing to interpret ancestor-descendant relationships. However, “grades” are widely grounded on functional assumption, thus being difficult to quantify. The current project tries: Firstly, to establish an interdisciplinary evolutive scenario of the main functional traits of *Homo sapiens* (such as, language, aesthetics, and morals. Secondly, to perform experimental studies to obtain stimuli capable of activating brain areas of processing of these tasks. Thirdly, to localize brain areas functionally active during the mentioned tasks, to check the hypothesis of a prefrontal localization of moral judgement, aesthetic appreciation and metaphorical using of language -the development of which would have been responsible for the late hominization period. Fourthly, to build computer simulated models of the evolution of the capacity of analyzing and cultullay transmitting evaluations. Fifthly, to analyse some turning point on the cultural evolution. Finally, to set up a model on the phylogeny of the already mentioned functional traits. How to identify grades and clades in the fossil record was mentioned in the Colloquium “Taxonomy and Systematics of the Human Clade” (Palma, February, 2000) as an area of particular interest of research in face of the V Congress of the IAHP (Barcelona 2003). The participants agreed in organising an International Group of research in human systematics to promote that kind of studies. To reach a tipification of the human grade is important in the systematics and paleontology fields, as well as in psychology, psychiatry, neurology, ethics, ethology, anthropology, biodiversity, and environmental studies.

Keywords: prevalence, hyperactivity.

Summary

Attention Deficit Hyperactivity Disorder (ADHD) is a common dysfunction in childhood, with a genetic basis and neuroanatomic and psicologic factors that produce attention deficit, impulsiveness and motor hyperactivity in children. In anglosajons countries the prevalence is of 5%, but they exist few study in our country. Our objective is to obtain the prevalence of the different subtypes of the ADHD in the school population between 6 and 10 years of the Island of Mallorca. We will use a neuropsychologic protocol of evaluation that includes questionnaires for parents and teachers, evaluation of the cognitive profile, evaluation of attention and impulsiveness through computers program (own versions) and full neurological evaluation of "soft neurological signs". The analysis of data will allow, to establish the prevalence, but also to compare the different evaluation methods used and to detect good screening tools for early detection.

Keywords: Food behavior, food preferences, implicit theories.

Summary

Leaving of the supposition that the feeding is not only a nutritional act but a behavior psychological as well as culturally determined, we intend the elaboration of a questionnaire and its application to a population of 400 subjects of 10 to 14 years of age dedicated to investigate the main factors implied in the appreciation or the infantile rejection of a list of basic foods in our culinary tradition. Later on another questionnaire dedicated to the parents will explore their implicit theories about the infantile feeding including its dietary beliefs, its valuation of the alimentary behavior of their children as well as the strategies before problematic alimentary behavior.

In the methodological order, the infantile subjects will value by means of scales from 1 of 5 for each food diverse parameters: consumption frequency, longing degree or aversion, healthfulness, consumption observed in parents and friends and existence of publicity. A global analysis of these answers will establish the influence of the growth and the sex of the children on the consumption of the diverse foods. Subsequently a multiple lineal regression will allow us to determine to what extent the consumption frequency can be dear starting from the qualities that the child attributes to the food (pleasantness and healthfulness) as well as of the models and social values (observation of the consumption on the part of his parents and friends and impact of the alimentary publicity).

Finally, the crossing between the questionnaires of the parents and their children will try to determine if the theories and more correct paternal alimentary attitudes belong together with the most varied and healthy diets on the part of the children.

Keywords: -lactams, -lactamases, antibiotics.

Summary

In the present investigation project we wish to synthesize a new set of β - and α -lactam structures and determine their stability against the β -lactamase hydrolysis. On the other hand, we will study the folding-unfolding process of β -lactamases in presence of antibiotics in order to have a better characterization of the binding site. Meanwhile we will carry out a molecular modeling study of the active site of the β -lactamases. The analysis of the results allows a more precise knowledge on the mechanism and role of the functional groups at the active site of these enzymes.

Keywords: asymmetric catalysis, enantioselection, synthesis in non-conventional solvents.

Summary

Basically, the project aims at exploring the action of some new catalysis in enantioselective synthesis carried out in both conventional and non-conventional media. For one, we will assay two novel binaphthalenic homoquiral monophosphins in biphasic systems (either water and a organic solvent or water and a micellar catalyst) for the reduction of allylic esters, the hidrosilylation of alkenes and metal-catalyzed ene reactions. On the other hand, we expect to be able to achieve the enantioselective protonation of either metal enolates, enols or dienols, enolsilylethers and ketenesilylacetals by means of a series of homochiral general acid catalysts ("homochiral Bronsted acids"). Some of these novel compounds are seen as minimalist catalysts for promoting inter or intramolecular hidrolysis, alchoholysis, etc of esters, amides, phosphates, etc. Finally, a series of homochiral Lewis acid derivatives of B, Al, Sc, Ti, Zr will be prepared "in situ" and assayed for "superacid" activity in classic Lewis acid promoted reactions in conventional media. Derivatives of lanthanide triflates and octandentate ligands will also be prepared and assayed for catalytic activity in nonconventional media.

Keywords: environmental impact, monitoring, analysis, pollution, atmosphere, waters, automation.

Summary

The objective of the present project is to contribute to the evaluation of the environmental impact produced by the setting up of a modern urban solid waste incinerator plant. For this purpose, the supervising plan established by the competent authorities regarding gas emissions and inmissions, waters, solid residues and soils will be followed. Contribution to the development of a new analytical methodoy in order to solve a series of needs and deficiencies detected on a series of preliminary studies is intended.

With regard to environmental impact control the main gaps of the existing analytical methodologies for the control of both gas emissions and inmissions will be considered, either in relation to organic components (aromatic polyclinic compounds, dioxines, furanes, etc) or inorganic components (Hcl, Hg, etc.).

With regard to services, automatic methods of analysis which facilitate the control of different types of waters involved in the process of energy cogeneration will be developed in order to reduce in this way corrosion processes and wear out of turbines.

A special emphasis on the study of inertization processes of the resulting ashes is intended to increase the inmovilization of the potentially polluting heavy metals which take place in dumping grounds.

Keywords: oil spill, modeling, dispersants, biodegradation accelerators, contingency plants.

Summary

The goal of this proposal is the global study at the processes provoked by hydrocarbon spills in the sea and the development of simulation techniques to monitor the spill and for its control by physical, chemical and biological techniques, together with the experimental verification of these techniques. The deduced results will enable the definition of the basic procedures to be included in a Contingency Plan oriented to reduce the environmental impact. This Contingency Plan has to consider in the model the specific characteristics of the geographical area under study.

Keywords: dried cured ham, dried cured loin, sobrasada, processes, diffusion, drying.

Summary

The main objective of this work is to establish the relationship between the process variables and some cured meat products evolution. The process variables considered will be room moisture and temperature, the raw material characteristics being maintained constants as well as air velocity. The products to be studied include: dried cured ham, dried cured loin and sobrasada. The engineering approach to the problem will include studying the general components characteristics (fat from different origin and meat from different muscles, chopped or not), as well as the additional mass transfer resistance due to casing in sobrasada and dured loin. For intermuscular mass transfer the effect of connective tissue will be considered. Modelling will be carried out from this general components. Given that the products under consideration suffer a noticeable shrinkage and/or show an irregular shape, it will be necessary to use numerical techniques, nevertheless analytical solutions will be used when studying the general components processed under regular shapes. The evolution of the products will be established experimentally and related, through the models, to process variables. This relationship will be established at both laboratory and pilot scale. A quality assessment of the products will be carried out by sensory analysis as well as standard analytical procedures (chemical, physical and mirobiological). For the sensory analysis an evaluation systems based on reference scales will be set up. The potential use of the results will be on the improvement of the control in the curing chambers due to the qualification of the influence on the product of the operating variables thus obtaining a better and more homogeneous quality of the products.

Keywords: metal oxides, porosity, sol-gel, liposomes, nanostructures.

Summary

Methods for preparing monodispersed sub-micron spheres of metal oxides (ZrO_2 , Al_2O_3 , spinels, etc.) will be studied: particle size should be variable according to the specific preparation. Procedures will involve controlled hydrolysis and polymerization of metal alkaloïdes, and preparation inside liposomes. Obtained and characterized these materials, optimum conditions for incipient sintering will be studied. This sintering process should lead to formation of porous materials where pore size and topology can be conveniently controlled.

Keywords: crystallization, urolithogenesis.

Summary

A main objective of the present project is the study of the early stages of stone formation. For this purpose, new “in vitro” methodologies with use of alive renal animal tissues will be developed. With such studies it could be obtained important data about the cell action in the renal calculi development. The experience of the Group permits to pursue the obtention of effective therapeutic solutions for treatment and prevention of this disease. This, the actual studies performed by the Group have clearly demonstrated the exceptional inhibitory capacity that phytic acid exert on calcium oxalate and calcium phosphates crystallization, being such inhibitory capacity increased by the presence of Zn(II), and acting Vitamin A as inhibitor of the enzymes that metabolizes the phytic acid. For this reason we expect to deep into the study of the “in vivo” effects of mixtures phytic acid/Vitamin A/Zn(II), specially the relation between the Vitamin A consumption and the phytic acid excretion. Other objectives of this Project are the development of new analytical procedures in the “kit” form, to apply to the evaluation of important lithogenic parameters such as the urinary crystallization inhibitory capacity of urinary phytic acid concentration. Finally, a study of the calculogenesis induced by Indinavir (drug used in the pharmacological treatment of AIDS) will be performed, with the aim to find possible solutions of this problem.

Keywords: molecular recognition, host-guest chemistry, guanidinium salts, squaramides, receptors, self-assembly, porphyrins, anion recognition.

Summary

In this research project we propose the synthesis and the study of abiotic receptors active in highly competitive solvents. The receptors will be prepared following a modular strategy and using charged interactions centers (guanidinium salts and squaramides) which will allow to establish simultaneously electrostatic and hydrogen bonding interactions with the substrate in order to compete with the solvating power of the solvent. These and other receptors developed by us will be used in conjunction with a signaling group (fluorescent) as the critical components in the development of new chemosensors. The utility of these chemosensors in the signaling and quantification of organic substrates and biologically relevant molecules will also be studied. We also propose the synthesis of giant acrobicyclic hosts, soluble in polar and non-polar solvents, having "box" like structures and featuring an enormous interior cavity, and the study of its complexation processes with organic guests. The self-assembly process of suitable tris-porphyrins leading to box "like" supramolecular assemblies will be investigated, as well as, its structures and functionality as an alternative to the previous covalent approach.

Summary

The main purpose of this project is the synthesis of new transition metal complexes with molecules that are known having biological and/or pharmacological activity. The research will be focused in derivatives of oligopeptides, nucleosides or nitrogen bases; in binary or ternary complexes of Schiff bases obtained from salicylidene aldehyde with peptides or amino acids, and in the obtention and study of binary complexes from bases with antiviral activity (acyclovir and others), or antineoplastic properties (thiopurines and others). The pharmacological and mutagenic activity of the complexes obtained will be also studied.

Summary

The general goal of this project is contributing to evaluation and control of environmental contaminants and the development of simple, sensitive and robust automatic methods and techniques of analysis. It is sought to reach this objective using sequential flow injection analysis (SIA), multisyringe flow injection analysis (MSFIA) and SIA-MSFIA techniques, in combination, if it is necessary, with pre-concentration flow techniques on liquid or solid support. The environmental parameters of interest are: phenols (EPA's priority), PAH's (EPA's priority), pesticides(warfarin, fuberidazole, thiabendazole, carbaryl, ...), metals (Al, Ca, Mg, Fe, Hg, As, Pb, Cu, Cd, Cr y Zn), and inorganic anions (phosphate, nitrate, nitrite, silicate, chloride and sulphate). The samples will be atmospheric aerosols and different kinds of waters (mainly public consumption and waste waters). This project is concordant with the work of our group of investigation during the last years which is reflected in the results fulfilled through previous projects: WASTEWATERS QUALITY MONITOR (Measuring and Testing of European Union MATCT93-008) and DEVELOPMENT OF NEW AUTOMATIC METHODS FOR THE EVALUATION OF ENVIRONMENTAL DEGRADATION PROCESSES THROUGH SEQUENTIAL INJECTION ANALYSIS (CICYT AMB94-0534).

Keywords: beta-lactam antibiotics, beta-lactamases, elastases, HCMV proteases, serine enzymes, chemical kinetic, computational chemistry.

Summary

In the present investigation Project we wish to determine the inactivation mechanism of three different serine enzymes (beta-lactamases, elastases and HCMV proteases) by beta-lactam antibiotics, classic monobactams and the new bridged monobactams which recently have been proposed as strong beta-lactamase inhibitors.

The choice of these three enzymes is due to their therapeutic relevance. Beta-lactamases are the main cause of diseases such as emphysema, arteriosclerosis and rheumatoid arthritis. HCMV proteases is essential for mature of patients and organ transplant recipients.

By Stopped Flow, FTIR, HPLC, RMN and UV measurements we will study the enzymatic. Theoretical calculation will be done for the modeling of the active site. Later we will propose the inhibition mechanisms. These mechanisms must perfectly explain the experimental results.

Once established the mechanism we will be able to postulate new inhibition structures.

Keywords: pyridoxamine, pyridoridine, vitamin B6, schiff bases, carbohydrates, PMP-dependent enzymes, advanced glycation process, amadorins.

Summary

Pyridoxamine and Pyridoxamine 5' phosphate are two forms of the Vitamin B6. Its function as coenzyme in Vitamin B6 dependent enzymes involves the formation of a Schiff base between its amino group and a carbonyl group and a carbonyl group of an alfa-ketoacid in the transamination processes and the formation of the Schiff base with the 4-keto group of a cyclic hexose in the catalytic process of formation of 3, 6-dideoxisugars.

Pyridoxamine has been recently proposed as an inhibitor of the advanced glycation process of proteins due to its capability of formation of a Schiff base with the carbonyl group of glucose.

In this work we will study from a kinetic point of view the formation and later evolution of the Schiff bases between PMP and alfa-ketoacids, as well as with sugars (aldoses and other cyclic sugars). We will pay special attention to the reactions with aldoses and we will investigate the role of pyridoxamine as reactive of the post-Amadori products generated in the glycation of amino acids. We will study the influence of the medium, the reactive ionization state and the reactive nature in general on these reactions.

Projecte finançat per la CICYT al Centre de Supercomputació de Catalunya (CESCA).

Període del projecte: 1999-2001.

Hores de càcul: 14.000.

Keywords: oxocarbon acids, aromaticity, NMR, theoretical studies.

Summary

The main purpose of this project is the systematic estimation of aromaticity in oxocarbon acids and derivatives (dianions, amides, esters,...) by means of computational methods. *Ab initio* theoretical methodologies are required to analyse the electronic structures of the different compounds of the oxocarbon series. Energetic (aromatic stabilization energies), structural (nearly equal bond lengths in the ring) and magnetic (magnetic susceptibilities, NCIS: Nucleus-Independent-Chemical-Shift) criteria have to be used to explore the aromatic character of the proposed compounds.

Keywords: PVC, DSC, TG, FT-IR, ftalates, molecular recognition, chemosensors.

Summary

The current use of PVC based polymers as building materials have a potential risk for the human health as well as for the environment due to the special features of these materials. The aim of this project is to develop an analytical protocol in a multidisciplinary approach, whose results will allow, as the first target, a straightforward identification of PVC materials. The analysis of substances that could present a toxic risk for the human health will be studies as part of a second stage. In that part PVC materials that are not in accordance with the UE regulations will be detected. The degradation and/or decomposition of these materials will be studied in the range of environmental conditions characteristic, and the presence of volatile organic compounds (VOC) will be evaluated. Finally, a line of new and specific chemosensors for ftalates will be synthesised and a new biotoxicity test based on hepatocytes will be explored. The expected results will allow the presence of PVC materials whose composition and properties are not in agreement with the UE and other regulations. The result will allow to go further in the environmental control of the PVC materials by using a multidisciplinary and integrated approach that will lead to the development of new analytical tools based on molecular recognition elements.

Summary

This is a project of technological development directed towards the production of interactive and multimedia education materials which could be used for the computer assited teaching of Organic Chemistry. There are three clear objectives, educational materials which are interactive and are used for the resolution of Organic Chemistry exercises, animations of reaccions mechanisms and short video clips of the basic technique used in an Organic Chemistry laboratory. All the educational material will be ellaborated to be used in any computer hardware (PC, mac, Sgi, etc). Thus the educational materials should be accesible using any internet browser. All the material could be placed in an internet server or sold as a CD-ROM. The methodology generated during the development of the project could be used for producing other educational material jus changing the contents and concepts.

Keywords: variability, mesoscale, transport, teledetection, circulation models, stochastic forcings, langrangian measuraments.

Summary

The main objective of this proposal is the analysis of the effects of high frequency atmospheric forcings on the emergence, persistence, and dynamics of mesoscale ocean structures, and of their consequences on transport phenomena. Special attention will be given to the transport of substances relevant to the dynamics of marine ecosystems such as nutrients or biomass and to the Mediterranean geographic area, Alboran and the Algerian basin in particular. Specifically we sought to apply three methodologies: numerical simulation of circulation models in the presence of several kinds of atmospheric forcing, analysis of lagrangian data obtained from float tracking, and the quantitative use of information obtained by teledetection. This objective is fully contained in the Programa nacional de ciencia y tecnología marinas, both because of the specific subjects considered and because of its applied and interdisciplinar character. Potential benefits include the improvement of modelling and prediction of physico-biological transport processes, and the development of novel techniques for processing and use of satellite data.

Keywords: endemic plants, threatened species, plant-animal interactions, photosynthesis, photoinhibition, drought, water stress, reproductive mechanisms, dispersal mechanisms, colonization mechanisms.

Summary

The project will examine both ecological and physiological factors that affect the distribution and abundance of a group of plants endemic to the Balearic Islands, and currently with a very restricted distribution (some considered as 'endangered' in the IUCN categories). The main goals of the study are: (1) to evaluate the population structure of the threatened plant species and (2) to determine the relative importance of biotic factors (interactions with animals in the different phases of the plant life cycle -pollination, herbivory and seed dispersal- or interactions with other plants) and of abiotic factors (such as plant responses to soil water deficit, a relevant trait in current mediterranean conditions) to be able to predict the risk of extinction of the threatened or endangered species in their natural habitat.

Keywords: *myotragus*, *artiodactyla*, *caprinae*, Balearic Islands, human-autochthonous fauna contact, insular evolution.

Summary

The first goal of the present project is the study of unknown aspects of the biology and evolution of *Myotragus balearicus* bate 1909, a bizarre dwarf artiodactyle (45 cm height at the shoulders) vanished about 4.200 years ago. We will study its diet, its functional anatomy, the differences between Mallorcan and Menorcan populations, the sexual dimorphism, sex ratio, as well as the heterochronic processes involved on its evolution and the taphonomy of some selected cave deposits. Another question to be studied is the role of *Myotragus* in the insular ecosystems. On the other hand, we will depen on the study of the contact between the first human settlers and *Myotragus balearicus*.

Keywords: water deficit, sap flow, photosynthesis, vine, ripening, quality, wine.

Summary

Irrigation is becoming to be a common practice in spanish vineyards, and new information is needed on the vine response to drought . The vine response to soil water deficit involve modifications in plant growth patterns, total leaf area, water relations, photosynthesis and assimilate partitioning. These changes have an evident effect on harvest. Water deficit severely reduce the plant production capacity. The new approaches now available to follow sap flow, and growth in to the shoot or whole plant, able to achieve a better understanding of the actual water used by the plant (important for irrigation dosage and schedule), as well as to attain a better understanding of the ecophysiological processes involved in crop yield determination and grape quality.

Keywords: biodegradation, naphthalene, pollutants, *pseudomonas*.

Summary

Aerobic naphtalene mineralization by *Pseudomonas stutzeri* AN 10 will be studied by using biochemical and genetical tools. These genes are chromosomally encoded and sufficiently distant (biochemically and genetically) from those alredy described in other bacteria. Main objectives of the project are: 1) Sequencing and evolutive analysis of the complete naphthalene pathway (*nah* and *sal* operons) of *Pseudomonas stutzeri* AN 10. 2) Characterization of the enzymes envolved in the degradation, specially when using methylated and halogenated substrates. 3) Improving the degradative capabilities by genetic manipulation of key enzimes in the pathway. 4) Study of chromosomal rearrangements when the strains are adapted to toxic xenobiotic compounds, like 4-chlorosalicylate. 5) Characterization of the diversity of the naphtalene genes in various types of bacteria (*Pseudomonas*, *Comamonas*, and Gram positives). Results can be useful for bioremediation purposes and for biotransformation of aromatic compounds into commercial products.

Keywords: non linear dynamics, optical systems, extended systems, stochastic resonance.

Summary

The aim of this project is to contribute to the understanding of spatially dependent systems described by equations with nonlinear terms and, that can also contain stochastic terms. Among the many systems where this occurs, we will basically concentrate on the study of optically passive non linear media (kerr medium, optical parametric oscillator, second harmonic generation, etc), noise induced phase transitions (especially the influence of the spacial correlation lenght of the noise), lasers with transverse and polarization dependence of the electrical field, systems of coupled non linear electronic circuits, stochastic resonance in extended systems (Fitzhugh-Nagumo model of excitability), biological processes (ion transport through membranes), etc. The project uses basically analytical developments and numerical techniques, although we aim to make an effort in the modeling with electronic circuits, and intermediate line between numerical simulations and experiments.

Keywords: nonlinear, cooperative phenomena, localized structures, excitability, chaos, spatio-temporal complexity, fluctuations, dynamical systems, feedback, biooscillators, advection, reaction-diffusion, nonlinear optics, semiconductor lasers, VCSELs.

Summary

CONOCE is a nonlinear and cooperative research effort in the general interdisciplinary context of the new directions of statistical and nonlinear physics, with special reference to the behavior of spatially extended systems with external forcing and or non-local couplings. On the one hand the project intends to contribute to the development of methods, concepts and description of generic behavior in nonlinear physics in 6 aspects: fronts, growth phenomena and localized structures. Prediction in spatiotemporal chaos. Systems with feedback. Cooperative phenomena in networks with nonlocal coupling, fluctuations, and synchronization phenomena. On the other hand, it addresses the use of these methods and concepts in 5 exploratory lines of strategic research: mixing, transport and localized structures in fluids. Patterns in nonlinear optics, cooperative phenomena, synchronization and feedback in semiconductor lasers, biological oscillators in excitable media and competition, coordination and cooperation of agents. General phenomena considered in the different research lines of the project include excitability emergence of localized structures, synchronization and coherent response to fluctuations.

Keywords: biodiversity, fluxes of matter and energy, biological production, tridimensional circulation, shelf-slope transfer, particulated matter, sediment, carbon.

Summary

The northwestern mediterranean canyons are morphological structures with high hydrodynamics activity and transfer of matter. The circulation inside of the canyons is highly heterogenic and its variability is controlled by several forcing mechanisms. The catalan sea is an excellent candidate area to study such processes in detail due to its characteristics. Similarly, the transfer of matter and energy in the canyons is also very complex, and the balance among the verticla and lateral supplies from the shelf and the slope is not known very accurately. The preferent transport of matter from shallow to deep environments through canyons generates a high biomass and production, with a possible exportation of dissolved organic/inorganic matter, which indicates that the deep sea can be more productive than what is was known up to now. In addition the external supply creates bioaccumulation zones in the canyon floor and that they are important reservoirs of biosdiversity. The canyons could be one of the environments with a higher diversity and production in the Mediterranean sea. The changes of the circulationinduced by the canyons can produce slope water intrusions and canyon biomass towards the shelf. Both situations have important repercussions in the marine system. This project results from the necessity of knowing the dynamics of the canyons in detail, to understand the delivery and concentration processes of continental material and export of the products from the endemic fauna living in this habitat.

Keywords: drip irrigation, red wine, yield, quality.

Summary

The global objective of this project is the study of deficit irrigation strategies in grapevine for red wine production with the aims of improving yield and maintaining or improving wine quality. For this purpose field experiments and physiological studies will be carried out in cv. Tempranillo in two contrasting climatic locations (Requena, Valencia and Consell, Mallorca) in comparison to the varieties of major local importance (Bobal and Manto Negro, respectively). The main aspects of this study will be:

1. Relationships between soil water availability, transpiration (sap flow) and photosynthesis at plant level.
2. Vegetative and productive grapevine responses to moderate amounts of irrigation applied in different phenological phases.
3. Fruit and wine quality parameters for production of red and rose wines.

The information obtained through these experiments should constitute an important basis to evaluate the economical impact of moderate irrigation in grapevines for red wine production, thus providing objective criteria for the respective ADC councils.

Keywords: coastal circulation, *Posidonia oceanica*, wave propagation, beach nourishment, beach monitoring.

Summary

The *Posidonia oceanica* areas key elements protecting the diversity of the Spanish Mediterranean marine ecosystem. Although seagrass significatively modify both the sedimentary processes and the wave propagation conditions on the continental shelf, and is the basis of a Mediterranean marine ecosystem, the extension and evolution of the *Posidonia oceanica* areas are not well defined and therefore not correctly considered in the shore protection and beach management programs. POSICOST will define an appropriate methodology to define: (1) extension (superior limit) of the *Posidonia oceanica* areas in the valencian coastline, (2) short time estimation of evolution, (3) selected monitoring indicators for a long-time monitoring to be integrated in the coastal GIS of the Generalitat Valenciana. The ocean circulation on the Mediterranean continental shelf is conditioned by the wind, its interaction with longshore currents generated by wind waves and the internal circulation associated to density fronts on the continental shelf. This coastal circulation is conditioning important processes as: (1) evolution of quality of coastal waters in time and space, (2) dispersion of contaminants along the coastline and (3) advance, retreat or death of the *Posidonia oceanica* areas. However, a Spanish 3-D model, to predict currents on the continental shelf, is able to provide reliable enough information to be used efficiently in shore protection, planning and management. Specially for this zones where the interaction of the dynamic and littoral processes and the *Posidonia oceanica* is significant, POSICOST will analyze those interactions. The sedimentary processes and currents interacts with the *Posidonia oceanica* (from 3 to 40 meters depth) and will be considered in a new 3-D currents model to be applicable to the valencian coastal waters. Along the Spanish littoral, the beaches are the critical production factor of the tourism industry. The beach stability has direct impact on both the regional economy and the local terrestrial and marine ecosystem. The beach nourishment is a key tool of modern shore protection and may positively or negatively affect the growth of the

Posidonia oceanica. POSICOST will analyze nourished beaches and marine desimentary deposits with may affect Posidona oceanica, and will define efficient methods to estimate the positive and negative impact of the coastal engineering works on the seagrass. Several pilot areas in the Valencian and SW Mallorca coastline are selected to be analyzed and monitorized during two years: (1) erosive beaches, (2) stable beaches, (3) accreted beaches, (4) nourished beaches and (5) marine sedimentary deposits useful for beach nourishment projects in the Valencian and the Balearic islands.

Keywords: hyperosia, hyposia, nitric oxide synthase, iNOS, nitrogen reactive species, antioxidants, catalase, superoxide dismutase, SOD, icefish, larvae, juveniles, *Channichthyidae*, antartica.

Summary

In this project we will study icefish development and measure the expression (mRNA and protein) of the three main isoforms of nitric oxide synthase as an indicator of tissue hyperoxia in icefish larvae. This study will be complemented with the measurement of oxidant stress markers as catalase and superoxide dismutase and nitrotyrosine modification of proteins as an index of peroxynitrite activity. The development stage of the icefish larvae will be determined by analysis of otholiths and by the ratio of ARN/AND concentration. The oxygen consumption by the icefish larvae will also be analysed experimentally. The results of these studies will be compared with the performed in adult icefishes.

Keywords: DNA sequences, molecular phylogenies, chromosomes, endemics, allopatric, evolution, competitive exclusion, *Chrysomelidae coleopterans*.

Summary

The apterous leaf beetle *Cyrtonus* are a suitable model for the high number of endemics to assess the effects of geographic isolation in iberian and balearic mountain ranges, by DNA analysis, citogenetic studies and morphometric measurements. Two mitochondrial gene fragments and another of nuclear ribosomal DNA will be amplified by PCR and then sequenced, to construct cladograms of phylogenetic interrelationships among populations and species of *Cyrtonus*, whose congruence with their karyotypes and geographic distributions would be also evaluated. Particular attention will be paid to the differences in the previous traits between species in allopatry and sympatry, to ascertain possible influences of character displacement and competitive exclusion. Moreover, in the large genus *Chrysolina*, the same two mitochondrial gene fragments plys karyotypes and host-plant affiliations will be examined in 10-15 further species, to obtain more supported cladograms than the previous ones based on 30 species, as well as a giving a major emphasis on the complex taxonomy and evolutionary patterns displayed in the Central European subgenus *Colaphoptera sensu lato*. The species of *Colaphoptera sensu lato* feed as a whole on plants of three distinct families, *Lamiaceae*, *Asteraceae* and *Apiaceae*, and might be a right group to investigate the shifts in host-plant affiliations from genetic standpoints.

Keywords: natural sources, biodiversity, hyphomycetes, fungi, taxonomy, pure culture.

Summary

Two coordinated objectives, using a similar methodology, are proposed, with the aim of acquiring a deeper knowledge of the mycota of aquatic and terrestrial *Hypomycetes* in the ibero-balearic region. Both tasks are designed within the framework of the long ter project 'Flora micològica balear'. The leader of the project will attempt to carry survey and pure culture description of aquatic (freshwater) *Hypomycetes* in selected habitats, and to complete a checklist of such fungi. It is expected that the pertinent Flora will be at an adavanced stage of completion by the end of the project. The rest of the team will attempt to carry out similar work on soil *Hypomycetes* from terrestrial and aquatic habitats and on terrestrial plant litter *Hypomycetes*, with the intention of eventually preparing a checklist, and at a later stage, a Flora on the pertinent organisms.

Summary

The presence of terrestrial carnivores is analysed at the world's largest breeding colony of Audouin's gulls, a threatened species. This was used as a natural experiment to assess the effects of predation at the level of both population ecology (changes in demographic parameters, population growth rate, dispersal and immigration, coloniality and conspecific attraction, source-sink dynamics) and conservation biology (extinction probabilities, culling of predators).

Summary

SIGEMAR (Marine Environment Management System) is a proposal to develop a project to allow to introduce the new technology management in oceanographic studies and its relation with the marine environment, through a computer tool that uses the communication advances (internet network), that can help and simplify the study of several physical variables and that can be used by any people who work in fields related with the marine research. This tool will permit quickly and easily to obtain graphics representation (simple or complex) essential for oceanographic researches using several scientific visualisation techniques. All these researches related will sciences and marine technologies have a clearly applied character and have an effect on several sectors (fishing, contamination, shipping,...). Therefore, this tool means an advance on the environment knowledge development and it can help to resolve its problems, now that, it helps and completes the researches in these subjects. The group of oceanography has expertise in the subject from its participation in international projects on similar type of problems.

Keywords: antartic ocean, plantonik production, mesocosms, temporal variability, trophics networks.

Summary

Antartic coastal ecosystems are characterized by a substantial planktonic production, which have an import contribution to the carbon flow in the Southern Ocean and, therefore, its role in the carbon budget of the golbal ocean. Present knowledge point to the control of coastal planktonic production in Antarctica by biological and physical factors. However, our present knowledge on the these control mechanisms is still poor, and we are, as yet, unable to predict the magnitude and fate of Antarctic planktonic production. The different hypothesis on the regulation of the planktonic production in the Antarctic coast must, therefore, be subject to experimental manipulation at a relevant scale, allowing the observation of the entire system. The goal of this project is to conduct the experimental worl with mesocosms needed to test the importance of different control mechanisms of Antarctic coastal production, to produce a predictive model, which will be tested against a detailed time series and oceanographic surveys. The model will then be used to estimate the role of Abntarctic coastal communities in the flow of carbon the Antarctic Ocean.

Keywords: food additives, identification, molecular methods, DNA.

Summary

Current EU directives laying down specific purity criteria on food additives other than colours and sweeteners presents an important gap in the technical description of the methods to distinguish between food additives locust bean gum and guar gum (E 410 and E 412, respectively). This makes possible the accidental (unadverted) or intentional (fraudulent) addition of E 412 to E 410 by producers and/or blenders. The consequences are: (1) locust bean gum producers (European companies) are subjected to unfair competition by their Asian counterparts (guar gum producers), and (2) end user companies using these additives in their processed foods may be incorrectly labeling their products due to the undeclared presence of gums mixtures instead of the labeled pure gum.

Our group has recently developed a DNA-based methods to identify and distinguish both additives. The methods are described in detail in a patent application jointly filed by our group (inventors) and UIB, CSIC, Universidad de Valencia and Carob S.A. as applicants. This projects aims to transfer the cited methods to Carob SA, a locust bean gum producer.

Títol: Evaluación del efecto reserva y de las medidas de control de fondo en la dinámica poblacional de *Posidonia Oceánica* en el Parque Nacional de Cabrera.

Investigadores: [DUARTE QUESADA, Carlos](#); [TINTORÉ SUBIRANA, Joaquim](#).

Departament: Institut Mediterrani d'Estudis Avançats (IMEDEA).

Empresa/Administració: TIRME.

Inici: 2000. **Fi:** 2000.

Títol: Evaluación del efecto reserva y de las medidas de control de fondo en la dinámica poblacional de *Posidonia Oceánica* en el Parque Nacional de Cabrera.

Investigadores: [DUARTE QUESADA, Carlos](#); [TINTORÉ SUBIRANA, Joaquim](#).

Departament: Institut Mediterrani d'Estudis Avançats (IMEDEA).

Empresa/Administració: TIRME.

Inici: 2000. **Fi:** 2000.

Títol: Demografía, hábitat y ciclo vital de *Margaritifera auricularia*.

Investigadors: RUÍZ DE ALTABA, Cristian.

Departament: Institut Mediterrani d'Estudis Avançats (IMEDEA).

Empresa/Administració: Ministeri de Medi Ambient.

Inici: 1999. **Fi:** 2001.

Títol: Efecto del riego sobre la ecofisiología, la producción y la calidad del fruto y el vino.

Investigadors: MEDRANO GIL, Hipólito.

Departament: Institut Mediterrani d'Estudis Avançats (IMEDEA).

Empresa/Administració: Herederos de Ribas, SA.

Inici: 1995. **Fi:** 2000.

Títol: Caracterización microbiológica del proceso de compostaje.

Investigadors: LALUCAT JO, Jordi.

Departament: Institut Mediterrani d'Estudis Avançats (IMEDEA).

Empresa/Administració: TIRME.

Inici: 1999. **Fi:** 2000.

ÍNDEX D'INVESTIGADORS

(En negreta els investigadors principals)

Adrover Fiol, Bartomeu	229
Afonso Marrero, José A.	190
Aguiló Pérez, Eugeni	170, 173, 277
Aguiló Segura, Paula M.	170, 173
Agustí García-Navarro, Àlvar	250, 261
Agustí Requena, Susana	246, 251, 256, 271
Alberich Martí, Ricard	135, 142
Albertí Serrano, Sebastià	96, 100, 101, 261, 262
Alcover Casasnovas, Antoni	173
Alcover Garau, Guillem	157, 158
Alcover Tomàs, Josep A.	241, 289, 290
Alemany Ferrà, Aina	21, 276
Alemany Hormaeche, Margalida	169
Aleñar Rebassa, Margalida	172
Alomar Canyelles, Antoni I.	179, 180
Alonso Espinosa, Francisco	158
Alonso Oroza, Sergio	201, 278
Álvarez Díaz, Dolores	81
Amengual Bunyola, Guillem A.	179
Amengual Colom, Antoni	199, 204
Antón Botella, Josefa	90
Arce Fernández, Ramón	217
Arregui Uribe-Etxeberria, Iñigo	195
Balaguer Covas, Jaume	105, 109
Balle Monjo, Salvador	72, 74, 205, 245, 251, 255, 257
Ballester Balaguer, Pau	228, 233, 235, 265, 266
Ballester Brage, Lluís	113, 278
Ballester Mortes, Josep L.	73, 195, 203, 270
Barceló Crespí, Maria	128
Barceló Mairata, Francisca M.	81, 87
Barea Roig, Rafel	202
Barrio Terol, Javier	225
Bassa Malondra, Antoni	227, 236
Benedí Benito, Vicente J.	81, 96, 97, 261, 262
Bennàsar Roig, Antoni	83, 275, 278, 279
Bergueiro López, José R.	91, 98, 224, 243, 276
Bernal Garcias, Fernando	202
Bernat Vistarini, Antonio	184, 186
Besalduch Vidal, Joan	87
Bibiloni Coll, Antoni	114, 138, 279
Binimelis Sebastián, Jaume	151
Blas Guasp, Javier	157
Blasco Esteve, Avel·lí	162, 279
Bona Garcia, Carles	59, 196
Bonet Piña, Maria L.	105, 109
Bonner, Anthony	179
Bornas Agustí, F. Xavier	209, 211, 265, 280
Borràs Sansaloni, Carme	216

Borrel Solé, Núria	100, 261
Bosch Fiol, Esperança	210
Bosch Juan, M. Carme	186
Bosch Zaragoza, Rafael	91, 98, 243
Bota Salort, Josefina	95
Brunet Estarellas, Pere J.	280
Buades Juan, Josep Maria	125
Bujosa Homar, Francesc	134, 143
Burges Cruz, Lucrecia	190
Busquets Xaubet, Xavier	250, 261
Cabot Bibiloni, Catalina	83
Cajal Blasco, Berta	216, 217
Calveras Maristany, Aleix	169, 171
Calvet Rovira, Francesc	148
Calvo Sánchez, Tomasa	144
Calvo Trias, Manuel A.	130, 280
Canals Casas, Ramon	215
Cantarellas Camps, Catalina	129
Cañellas Mut, Jaume	225
Cañellas Serrano, Nicolau	94
Capó Cañellas, Magdalena	222
Carbonell Huguet, Marc	203
Carbonero Gamundí, Maria A.	189, 191
Cardo Jalón, Esther	214
Caro Fernández, Arturo	223, 230
Carot Giner, Jaume J.	196
Carrasco Martorell, Loren	136
Cartwright, Julian	244
Casado Raigon, Rafael	166
Casas Ametller, Montserrat	74, 198, 265, 275
Casasnovas Casasnovas, Jaume	142, 144
Casassas Ymbert, Jordi	132
Caselles Costa, Vicent	34, 205
Castel Sánchez, Juan Ramón	247
Castro Hernández, José Juan	85
Castro Iglesias, M. del Carmen	216
Castro Nogueira, Laureano	190
Castro Ocón, José Aurelio	82, 84, 89
Castro Valdomar, M. Jesús	125
Catalán García, Francisco	247
Cateura Bennàsser, Pau	122
Cavanillas Múgica, Santiago	47, 48, 50, 161
Cebolla Rosell, Vicente	247
Cela Conde, Camilo J.	190
Cerdà Martín, Víctor	223, 280
Cesari Aliberch, Eduard	199, 276
Cifre Bauzá, Joan	204, 234
Cladera Munar, Magdalena	175
Clar Matheu, Albert	138

Coca Payeras, Miquel	159
Colet Rafecas, Pere	205, 244, 245
Colom, Miquel	223
Coll Conesa, Jaume	130
Coll Monserrat, Josep	85
Coll Parets, Miquel	221, 231
Coll Vicens, Bartomeu	140
Comas Rubí, Francesca	116
Conde Riera, Pere B.	109
Conte Visus, Antoni	227
Corbera Pou, Jaume	180
Cortés García, Guadalupe	100
Costa Bauzà, Antònia	227, 236
Costa Ribas, Benjamí	130
Costa Torres, Antoni	228, 233, 234, 275, 280
Crespí Bestard, Catalina	105
Crespí Cladera, Rafel	169, 171
Crespí Rotger, Sebastià	105
Checa González, Antonio G.	101
Chirivella Romero, Camilo	247
De Benito Crossetti, Carol	114, 197
Del Olmo Iturriarte, Almudena	186
Delgado Domínguez, Adelaida	265
Descals Callisen, Enric	253
Deyà Bauzà, Miquel	124
Deyà Serra, Pere M.	228, 233
Díaz de Castro, Francisco J.	186
Díez Betencourt, Clara	242
Dols Salas, Nicolau	180
Doménech Sánchez, Antoni	96, 262
Domingo Palomares, Herminio	215
Domínguez Laseca, Félix	224
Donoso Pardo, Josefa L.	221, 231, 232

Villanueva Bohigas, Gemma	130
Yañiz Aguado, Carlos	138
Zimmermann, Martin	244

ÍNDEX D'ABREVIACIONS

- Aj. EU: Ajudant/a d'Escola Universitària
Aj. U: Ajudant/a d'Universitat
AGR: Programa nacional d'investigació i desenvolupament agrari
ALI: Programa nacional de tecnologia d'aliments
AMB: Programa nacional d'I+D en medi ambient
ANT: Programa nacional d'investigació a l'Antàrtida.
As.: Associat/da
B: Becari/ària
B (reinc.): Becari/ària postdoctoral de reincorporació
BIO: Programa nacional de biotecnologia
C: Col·laborador/a
CEU: Catedràtic/a d'Escola Universitària
CICYT: Comissió Interministerial de Ciència i Tecnologia
CLI: Programa nacional d'I+D sobre el clima
CSIC: Consell Superior d'Investigacions Científiques
CU: Catedràtic/a d'Universitat
DGES: Direcció General d'Ensenyament Superior
DGESIC: Direcció General d'Ensenyament Superior i Investigació Científica
DGICYT: Direcció General d'Investigació Científica i Tècnica
EJC: Equivalents de Jornada Completa
FD: Fons FEDER
FIS: Fons d'Investigació Sanitària
HID: Programa nacional de recursos hídrics
IMPIVA: Institut per a la Modernització dels Processos Industrials de València
MAR: Programa nacional de ciència i tecnologia marines
MAST: Marine Sciences and Technologies
MAT: Programa nacional de materials
MEC: Ministeri d'Educació i Ciència
PB: Programa bàsic (Programa sectorial de promoció general del coneixement)
PETRI: Projecte d'Estímul a la Transferència de Resultats d'Investigació
PM: Programa de medicina
PS: Programa sectorial
P1: Projectes d'investigació bàsica no orientada
P2: Projectes d'investigació bàsica orientada
P3: Projectes d'investigació aplicada
P4: Projectes d'I+D en cooperació
RACE: Research and Technology Development in Advanced Communications Technologies
SC: Programa sectorial d'I+D agrari i alimentari del MAPA
SM: Projecte simplificat d'investigació en biomedicina
Tèc.: Tècnic
TEL: Programa nacional d'aplicacions i serveis telemàtics
TEU: Titular d'Escola Universitària
TIC: Programa nacional de tecnologies de la informació i de les comunicacions
TU: Titular d'Universitat
UE: Unió Europea
UNESCO: United Nations Educational Scientific and Cultural Organization
